Is there any sort of FAQ regarding the pros and cons of handheld scanners? I'm thinking of getting one for the SOLE purpose of listening to pit/driver communications at sports car and Indy car events. I have been using an old Regency HX-2000 and it filled the bill till it died. I would like more audio power, but otherwise it was adequate.

The way you erase the memory is to hold 1, 9, and WX. Then, turn on the

scanner. Be sure to have your important freq's written down, or else
they're a
goner! If I remember correctly the last time I did it, you'll get some
locked out test

freq's in a few banks. I had one in the 700's somewhere.

Good luck.

From: dteague@csc.com
Message-ID: <4lf9mq$g06@explorer.csc.com>
Source record: 235521

It's been pretty dull around here since Mr. News left the field without posting his proof of an exemption to the ECPA for news orgs scanning for profit. I'm still curious (and skeptical) as to whether there is such an exemption, and would like to have any pointers anyone can provide.

On a related subject, I'm beta-testing a cellular device and have a need to monitor the rf output from the device. Just out of curiousity, does anyone know if monitoring your own xmission in the cellular band is technically illegal? It's not going to stop me, but I do get a kick out of these legal issues. Some of these so-called scanning laws are very funny.

>----
>Matt Roberts, KK5JY,
>mattro@radware.net

Why can't you just accept the fact that some of us are "code impaired". I
have always been involved in electronics, but I limit my involement to
shortwave and scanning. Why? Because I get lost in the dots and dashes.
Call it a mental block, attention deficit or whatever the PC thing is to
do. The fact remains that I am not lazy or stupid. I just have difficulty
with this language.

No, I don't want Amateur Radio to become another form of CB, but the hobby
shouldn't be restricted by such narrow thinking as expressed in this
thread and other postings. There are many of us out here that support the
concept of amateur radio, but haven't been able to overcome the code
requirements.

The problem of operators with CB mentality is not the result of ones
inability to copy code at 5... 15.... 25..... words per minute. These
problems are the result of individuals not respecting fellow users.

Did these individuals become more "ham-like" because they needed to know a
few details about technical theory? No!

Will these individuals become more civilized through the process of
mastering the code. I doubt it!

Maybe the amateur radio training of the future should include interaction
skills as well as the technical data.
```

At this time of possible reallocation of the radio spectrum to the highest bidder the hobby needs to welcome the various user groups and accept the fact that we have differring abilities and intrests. The pressure is on to put the frequencies to the best possible use. Corporation $$$$$$ vs the hobby. Listen and evolve to grow. Put away the "I did it, so you must" mentality.

I wish that I was the one to buy the gear that started this thread, but my receivers will have to suffice........

Source record: 235526
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Does anyone have the drive-thru frequencies for G.D. Ritzy's in OH?

I know the Speaker (repeater) frequency is 35.100 Mhz, but would like to know what the Headset (input) frequency is.

I think the headset is on one of the following frequencies:

151.6250 151.6550 151.6850 151.7150 151.7450 151.7750 151.8050 151.8350
151.8650 151.8950 151.9250 151.9550 154.5150 154.5400 154.5700 154.6000
169.4450 169.5050 170.2450 170.3050 171.0450 171.1050 171.8450 171.9050

Can someone in OH verify the headset frequency?

Thanks,
Bob

The following is a list of PSP barracks and the frequencies they operate on.

Channel A 155.580 Base/154.950 Mobile

Lamar, Clinton Co. Shamokin, Northumberland Co.
Trevose, Bucks Co. Selinsgrove, Snyder Co.
Coudersport, Potter Co. Somerset, Somerset Co.

Channel B 155.670 Base/155.910 Mobile

Foglesville, Lehigh Co. Fernridge, Monroe Co.
Philadelphia, Philadelphia Co. Avondale, Chester Co.
Danville, Montour Co. Milton, Northumberland Co.
Bloomsburg, Columbia Co. Milesburg, Centre Co.
Limerick, Montgomery Co. Ephrata, Lancaster Co.
Harrisburg, Dauphin Co. Swiftwater, Monroe Co.
Clearfield, Clearfield Co. Chambersburg, Franklin Co.

Channel C 155.505 Base/155.850 Mobile

Media, Delaware Co. Frackville, Schuylkill Co.
Phillipsburg, Centre Co. Rockview, Centre Co.
Dublin, Bucks Co. Schuylkill Haven, Schuylkill Co.
York, York Co. Hamburg, Berks Co.
Jonestown, Lebanon Co. ??? Bedford, Bedford Co.

Channel D 154.665 Base/ 158.910 Mobile

Montoursville, Lycoming Co.
Carlisle, Cumberland Co. (mobile units can be heard on both B & M freqs.)
Ebensburg, Cambria Co.

Channel E 154.695 Base/156.150 Mobile ????
---
all barracks listed here have base and mobile comms. on 154.695 only
^^
Reading, Berks Co.
Hollidaysburg, Blair Co.

Channel F 154.920 Base/154.830 Mobile

Lewistown, Mifflin Co.

Channel G 155.445/???.??? Mobile
---
all barracks listed here have base and mobile comms. on 155.445 only

^^

Embreeville, Chester Co.
Newport, Perry Co.
Huntingdon, Huntingdon Co.

Turnpike F1---159.075 F2---159.045

These barracks are located along the turnpike proper, along with
maint. buildings. Other locations are maint. sheds only.

King of Prussia, Montgomery Co. (Police and Maint.) East-West Pike
Bowmansville, Lancaster Co. (" " ") " " "
Newville, Cumberland Co. (" " ") " " "
Somerset, Somerset Co. (" " ") " " "

Pocono, Carbon Co. (" " ") Northeast Extension

This list is in no way exhaustive. In fact, I work on it every
time I travel. Any additions are very welcome.
Other frequencies that are definitely used include the following:

154.755---mobile to mobile
155.460---TAC-1
155.475---National (used to contact local PD's by radio...other times they
will use the County dispatch, as here in Clinton Co.
where I go to school. In Delaware Co. and the Philly
area, they notify local PD's by phone.)
155.490---PA Regional net "CLEAN"
158.760---listed as Liquor Control Units or Administrative use in various
sources. I have heard it used in Harrisburg as a car to car
private channel like the TAC-1 channel.

I'm looking to buy a used, cheap (ie $50-60) handheld to use as a knock around. Only need several channels (10-20 will do) and 150's and 400's. All I am really concerned with is that it WORKS. Maybe something along the lines of a bc140xlt.

I'll pay shipping (or split it depending upon how good a deal) and am willing to send half up front and half after I make sure it works.

If you have something, let's talk.

I know the new 49MHz cordless freqs (for the new 25 channel cordless phones) was posted earlier (and probably several times), but I can't find the post.

Could someone email me the freqs or direct me to an internet address to find them?

Thanks,

PKH

Yeah, $357, then add their shipping cost in. Still a better deal, but
their initial prices are not always that good.

They are very close. The 2006 is a bit tighter. For example an active frequency on 154.860 bleeds over onto another active frequency 154.845 on most of my handheld scanners, just a little bit on the 9000 and not at all on the 2006. The sensitivity of the 9000 seems to be just a little better than the 2006. The alpha display and other features like per-channel attenuator and data skip, make the 9000 more usable in a wide variety of environments.

I have a scanner for sale.

Realistic PRO-2080 50-Channel Directy Entry Programmable Scanner
4 yrs old.

Memory Backup
Lock-Out
10 Channel Banks - 5 Channels per bank.
Priority Channel
Two-Sec. Scan Delay
Direct Frequency Search
Monitor Memories
Weather Band Key - 7 Pre-programmed weather channels
Backlight

Bands Covered:
29 - 29.7 MHz (ham radio 10 m)
29.7- 50 MHz (VHF Lo)
50 - 54 MHz (ham radio 6 m)
108 - 136.975MHz (aircraft)
137 - 144 MHz (government)
144 - 148 MHz (ham radio 2 m)
148 - 174 MHz (VHF Hi)
406 - 450 MHz (ham radio & government)
450 - 470 MHz (UHF Lo)
470 - 512 MHz (UHF Hi)

Telescopic Antenna - 3 segments

Originally purchased for right around $100.
I will sell for $49 + Shipping

I hate seeing people put things up for ridiculous prices. I saw an ad in
a local computer magazine, some guy was trying to sell stuff like 14.4 modem
for $100, 4mb RAM for $120 each, 20mb HD for $100. I had to respond. Pissed
him off BAD. Tough.

If people set a fair price, no problem. But if someone wants $200 for a
scanner that retails for $300, but I know Rat Shack has it on sale for $189,
then I am not going to keep quiet.

What he is asking is if the scanner has been programmed for Ontario.
If so, would you just put "ON" in instead of the state abbreviation
(CA, MO, TX).

Apparently you do not kow much about scanners Bruce Markowitz.

As for the BCT7/BCT10, they work fairly well and most states use the
same frequency guidelines. So if you set it on CA when you are in
Oklahoma, it will still work perfectly. As for Canada, I do not know.
I have never seen a pre-programmed scanner with Canadian provinces
programmed in.

But, have a nice trip anyway.

Oliver P. Timme wrote:

> So come and visit the World Frequency Database. Enter your favorite frequencies to let it
> grow fast.

I managed to log onto this database hoping to find some German freqs -
it is claimed that there are 1600. Trouble is that you can't load all of
them (using the country code D) because there is a limit. The state
codes are all mixed up for all countries and I wasn't sure of the coding
- I suspect that this will increasingly be a problem (with all the US
states mixed up with all the UK counties etc). Why not fan out into
separate country pages where the state codes are country-specific.
The biggest problem with the e-mail feature is that you have to download
the entire results page *before* you can e-mail them - so there's no way
round the limit that way either.
The fields in the database seem rather limited - there are no "usage"
etc fields so that you can zoom in on police, mil air etc

Great idea in principle, but needs to be tuned a little if it's to catch
on
Andrew

1863. Any service to "upgrade" old AR8000 to current?

Newsgroup: rec.radio.scanner
Date: 1996-04-23 00:00:00 UTC
From: ac184@FreeNet.Carleton.CA
Message-ID: <4linr0$kjs@freenet-news.carleton.ca>
Source record: 235401

Hi all,

I have a "first batch" AR8000, and I know (from the late, lamented mailing list) that there have been a couple of performance-enhancing mods made to the later scanners. I'm going to get a Scout, and I figured that since my scanner will need to be modified anyway I'd try to get it as updated as possible, all in one go. Does anyone have a list of the changes that could be made to an older AR8000 to bring it up to date, or even better, know of company that would do it? (like Opto)

Many thanks,

Tim

Hi,

Try entering a frequency in the scanner and then press the "E" key. This
should store the frequency in the specified memory location (1-100).

You might be trying to enter the frequency and pressing the "MANUAL" key.
This will cause an "ERROR" message.

Good luck,
Stephen Phipps

I'll be attending the El Toro Airshow this upcoming weekend. I have a slew of Blue Angels and El Toro frequencies, but was wondering from any El Toro vets, 1. What would all of the displays, especially the MAGTF demomstration, be heard on? The tower? Or maybe some other channel. Also, from anyone who has seen the Blues this year, what frequencies are they using. The book I have shows 275.350 as their primary channel. If anyone would like, I'll post the entire list of El Toro and Blue Angels frequencies that I have. Thanks.

1875. Cellular telephone frequencies

Newsgroup: rec.radio.scanner
Date: 1996-04-23 00:00:00 UTC
From: reptile@goodnet.com
Message-ID: <4lj8kl$43i@news1.goodnet.com>
Source record: 235413

Could someone please email me a list of the exact cellular telephone frequencies? Not a frequency range, I know it's 869.01-894 MHz, but I am requesting a list of exact frequencies. I am really just interested in the 333 base frequencies.

1876. Airport and LW Beacon WWW

Newsgroup: rec.radio.scanner

Source record: 235414

Check this out out - http://www.cc.gatech.edu/db1/fly

This site has a searchable database of airports and LW air navigational beacons. It gives detailed information on all air facilities, public and private (yes AFB's are there) in the city of your choice. Includes all sorts of info along with the frequencies used.This is a good one, check it out!

Just a comment. If the unit was bought in Sweden, there
probably isn't the cellular diode, just the speed increase one. I
don't know the laws in Sweden, but I know that many other countries
either don't have the restriction on monitoring cellular that we have
in the good old USA, or there frequencies could even be somewhere
other than the range for the USA. So there would probably be only one
diode. Carefully snip it(just in case it for some reason does some
awful thing, you can fix it) and hopefully enjoy.

What part of central PA are you calling from? There is a BBS in Ft.
Loudon, PA (717-369-3637) that used to have lots of frequencies on it!
For the most part, they were federal, but there were also county
listings for Adams, Cumberland, Franklin, and Washington Co., MD.
There was also a list of PSP frequencies on there somewhere.

I work for Sears Loss prevention, and we use general business radios. The cost of getting frequency-specific radios, and also the licensing, would cost a fortune in Sears' eyes. Anyway, check these freqs: (Which are allocated for general business mobile radio)

462.550
462.5625
462.575
462.5875
462.600
462.6125
462.6250
462.6375
462.650
462.6375
462.650
462.6675
462.675
462.6875
462.700
462.7125
462.725

I know for sure that JC Penny's uses these freqs also, but keep in mind that we seldom use our radios, because we sit in our camera room and only leave after we see merchandise concealed. Anyway, have fun, and let me know if you hear anything interesting!!

>
> I've noticed that many higher end scanners will pick up SSB & USB as
> well as NFM, WFM and AM. Could someone tell me what SSB and USB are
> and what you can listen to while in these modes.

Kim & Darren:

"SSB" stands for Single Sideband, "USB" is Upper Sideband, there is also
a "LSB", Lower Sideband. SSB is a type of transmission that can be either
USB, or LSB.

AM = Audio Modulated, commercial aircraft, military aircraft frequently use this mode.
NFM = Narrow Frequency Modulated, police, fire, EMS, business band, FBI, etc.
WFM = Wide Frequency Modulated, commercial FM broadcast stations, T.V., etc.
SSB = Sindle Sideband, HAM radio, military

That's a short description.

Bill Crocker

1889. CB radio, looking for a home...

CB Radio for sale:

Cobra 19 23-channel CB radio, good condition, make me an offer...

Package includes:

- CB Radio
- Bracket Screws (Radio to Bracket)
- Microphone
- Magnetic Mount Mike Clip

Features include:

- On/Off Volume Control
- Squelch Control
- Channel Selector
- Modulation Indicator Light
- External Speaker Jack

This CB traveled quite a few miles with me, but moved from the car to the basement when I got my cell phone. Too many toys, too little room! It worked fine last time it was installed in my vehicle.

>
> Thanks!
> Rich

=====
Hi, Rich...
For a receiver, the slight mismatch between 50 and 75 ohms is negligible.
Receivers, unlike transmitters, are not so specific in their need for any
exact match. Most of those who say it *does* matter are working on the idea
that a receiver, like a transmitter, needs that match for effective transfer
of the signal, while in fact, the sensitivity of the receiver is generally
so good that the slight mismatch is not noticed by the receiver.
Hope this helps.

Folks,
567's do not lock easily in the presence of lots of energy at frequencies
other than the one of interest. A good filter passing 20-250 Hz should
precede the 567. You may want to consult a textbook on audio filter
design. Two quad op-amp chips should do the job.
You want to pay attention to the bandwidth or lock range you set the 567 up for.
You'll need to set it wider if you want the thing to lock on any freq in
the band; then set the freerunning freq to the middle of the band and the
filter should center there also.
In this setup you can read the 567's oscillator with a cheap counter.
Reading the 567's oscillator gives you a clean tone, locked to the PL from

the signal, but without all the voice included to confuse the counter.

For detecting individual PL freqs you can make the lock range narrower &
put the free-run freq equal to the target freq.

You may well find that you can make the 567 lock on that data burst if you try.

Good luck.

I had a similar problem. The fix turned out to be very simple; maybe
you should try this before attempting "tuning up" your scanner:

Open up the case and look at the antenna connector inside the scanner.
The center post from the connector is wired to the top of the circuit
board with a short wire. In my scanner, this solder on the circuit
board end of the connection had fractured, my guess is from flexing of
the rubberduck antenna. Just reheating the solder fixed the problem!

1898. Re: LAPD Moving to 800MHz next?

Newsgroup: rec.radio.scanner
Date: 1996-04-23 00:00:00 UTC
From: cardenas@kaiwan.com
Message-ID: <317cf9d3.1980815@nntp.kaiwan.com>
Source record: 235436

As I understand it, those 800MHz channels are in use now by LAPD Traffic Control officers.

While LAPD does access a lot of data, they would not require that many channels just for data. Most data, even for larger cities is done on one or two channels with ease and without overload. When one thinks about it, a field officer requires just a few lines of data most of the time. On occasion he/she may receive a page or two if the suspect has a long history.

Given the efficiency of packett/data modes, most requests are sent and received in about one second; once the data is ready and relayed to the mobile Display. Many, many mobile units can be serviced within any single minute. Again, clear indications that LAPD will not require that many channels just for data.

Well I guess that all the Ham people that use digital should have to test on using the "C" language or Assembly. If you cannot program in one of those then you shouldn't be able to connect your computer to a radio. So much for CODE. "Just let me hook this cable to that thing and start typing.....", "When is the next pass of RS-232 ?...." "I don't want to KISS it I just want to connect...." Yea we all know you understand CODE.....

Been there, done that, bought the t-shirt!

What is even better is to program in their store's loss prevention frequencies. This way the display scanner is blasting away with the details of their in-store surveillance operations.

Give it a try!

1903. Re: SSB & USB

Newsgroup: rec.radio.scanner

>I've noticed that many higher end scanners will pick up SSB & USB as
>well as NFM, WFM and AM. Could someone tell me what SSB and USB are
>and what you can listen to while in these modes.

SSB stands for Single Side Band
USB stands for Upper Side Band
LSB stands for Lower Side Band

There isn't such a mode as SSB, SSB is both USB and LSB... So instead of seperating everything, and saying a radio has SSB and USB, what you are saying is a radio has SSB, USB USB LSB LSB. Confused yet? I am...

SSB is the term used for the type of operation, USB & LSB are the accual modes you are in when listening, like FM or AM.

Anyhow most all 2 way radio traffic below 30mHz is always either USB or LSB, depending on the location of the band, and what type of organization you are listening too. Also the broadcasters are all using AM mode below 30mHz. Its not common to find traffic above 30mHz in SSB, but it can happen... Those features are usually there for the lower bands only.

The NeXus!

Pull off the top cover of the 2006. Look behind the number "3" on the keypad(inside the unit) You will see two diodes. one is for the cell mod, the other for scan rate increase. If you cut both, you will get both mods.

Hope that helps!

K&DB>From: apache@i1.net (Kim & Darren Baucum)
K&DB>Newsgroups: rec.radio.scanner
K&DB>Subject: SSB & USB
K&DB>Date: Mon, 22 Apr 1996 02:39:06 GMT
K&DB>Message-ID: <4lermq$q8l@news1.i1.net>
K&DB>Organization: Internet 1st

K&DB>I've noticed that many higher end scanners will pick up SSB & USB as
K&DB>well as NFM, WFM and AM. Could someone tell me what SSB and USB are
K&DB>and what you can listen to while in these modes.

SSB=single side band
USB=upper side band
LSB=lower side band
DSB=double side band
NFM=narrow band FM
WFM=wide band FM
AM=amplitude modulation
FM=frequency modulation
carrier="no modulation"

Broadcast FM is really WFM, as is TV audio.
Most public service/mobile radio is NFM.
USB and LSB are specific types of SSB, i.e. it specifies which band.
DSB is both USB and LSB but no carrier.
AM=DSB+carrier

Beneath 30MHZ, generally the transmissions are AM, USB, and LSB. For example,
most citizen band is AM in the range of 26.965 to 27.405 Mhz. Aircraft is
usually AM also.

Military/Federal shortwave is generally under 25 MHZ and is usually USB. A comm
military air freq is 11.175Mhz. The military personnel call this freq tripple
one seventy five upper. There are USB freqs for all feds and military including
air force one. HAM (amateur radio operators) use LSB and USB. Their convention
is freqs beneath 10MHZ are LSB and freqs above 10MHZ are USB. At 10MHZ what
happens? That is where WWVV is located. Shortwave broadcasts are generally
AM, but a few are USB.

The reason you hear so much about SSB is many scanners are full coverage
(100KHZ to near 2G). It would be silly to make a wide range scanner without
SSB (although ICOM made one). Thus, if you cover under 30MHZ, you need SSB.

At present, these full coverage scanners do not work as well as a portable
shortwave radio (such as Sony 2010), but are handy if you only want
to carry one radio.

Now aren't you sorry you asked!

There is a lot of emotional feelings on both sides of the argument concerning CW requirements for Ham radio operators wishing to use HF. As of now, International Treaties require that some proficiency in CW be demonstrated. The treaties leave that demonstration up to the individual countries to determine.

It would not be unreasonable to assume that when the international communication treaties are revisited, that the CW requirements may well be dropped. That would allow the signatories to do as they please with CW requirements.

Please folks, take it to E-mail. Both sides, please make your continuing dialog take place one-to-one. The resources used for POSTING this ongoing diatribe might be better used instead of 5 new posts a day.

The intelligence of the parties involved is not being used to any constructive purpose. Yes, Cheek acts like an arrogant dictator on his FIDO net, but this usenet is not fido, Cheek is NOT the moderator of THIS news-group, and he is only one person of many who use THIS platform. Do you want to waste time reading mail by 6 to 10 people about this ongoing squabble? There are alot of good people that CAN exchange ideas, lets concentrate on those who can communicate in an effective, friendly, knowlegable way. Please remember why we came to this newgroup in the first place...The FIDO net folks must come up with their own solution, whatever it may be...Good Luck!

Now, if the squabbling parties would please take this to personal e-mail, we as a group would appreciate it. Yes, it will take willpower not to continue broadcasting this ongoing diatribe with postings, but by doing this on a one-to-one basis, you'll be showcasing your ability to talk directly to the other parties, and to show courtsey to the readers of this newsgroup in general. Taking it to direct e-mail is a sign of mature intelligence.

Thanks,

Yea, BUT...

Those 950-1450 Mhz signals are (down)converted to 75MHz just as it
leaves the receiver within the dish or VERY close to it.

Long(er) lengths of coax are not as critical at 75MHz. Coax loss
factors still apply but at 75MHz.

I quite agree with you, Steve. I've been asking this question to myself for quite a while now, and have asked around if there is a quick way of WIPING the memories and not just clearing the password. I've not had much luck, but feel sure that there must be some way of doing it. If I want to delete all my freqs in a hurry, I have to go to delete mem-data, then select EACH AND EVERY DAMNED BANK whereas other scanners, with less features, have this "feature" as a matter of priority. I just don't understand it.

****
If anyone knows a way of wiping p/w protected freqs from an AR8000 quickly, either from a technical or keypad way, PLEASE TELL!
****

Thanks.

That's correct! It is legal to monitor cellular, wireless phones etc as long as you don't give information about what you have heard to others. As i wrote before, I have mixed p the 2005/2006... The Handic 0080 is in fact a 2005. So no HYPERSCAN... :-S

> it is better than re-runs on the tube.

Duly noted, enthusiactically agreed to, and triply underlined.
By the way, for all you fans of the Cheek Daily Digest, I received more than enough 'yea' responses to warrant resurrecting the Digest, but alas, Mr. Cheek has apparently come down with a bad case of writers cramp <w>
Oh well, what do they say about gift horses?

1931. Freq's wanted all available Clackamas County, Oregon.

Requesting all known frequencies for the Clackamas County, Oregon
area.
Police, medical, fire, government, federal, railroad, towing etc.
reply here or via e-mail
Thanks
Ron

<:-) Yes, I guess I am being too cautious, but anyway I've decided on
getting one of the 900 MHz cordless types (after I budget somewhat
more than I'd expected). Better safe than sorry, I reckon.

Thanks to you, and all others who've offered me with the good info to
sort out my best choice. Much appreciated!

Hi-tech is right! Its the only way to go these days. I've heard a
lot about the saber but its a larger and more expencive radio. How is
it programmed? how many channels?

I have 7 radios in my Jimmy and I'm trying to cut down its getting
harder and harder to listen to so much. Not much I can do though.
Every one is on a different system and requires a sperate radio.

I take out a few of mine in a bundle every day so there is less to
steal. Plug in plug out....etc.

Yup it sure seems like it. We are also stuck with having to hear the
city works depts. hydro. bylaw inforcement and I"m not sure what else.

I only have the three frequncies in the public service band programmed
into my radio and have heard both ends of the conversations with the
FDP It still seems they are sticking to the three and not using the
rest. but again its shared with the other services.

```
: Just a comment. If the unit was bought in Sweden, there
: probably isn't the cellular diode, just the speed increase one. I
: don't know the laws in Sweden, but I know that many other countries
: either don't have the restriction on monitoring cellular that we have
: in the good old USA, or there frequencies could even be somewhere
: other than the range for the USA. So there would probably be only one
: diode. Carefully snip it(just in case it for some reason does some
: awful thing, you can fix it) and hopefully enjoy.

: -Dave

This is true..... In the 2006 service manual, it has a list of
countries, and corresponding to the country where the unit was shipped, it
tells if the diode is to be inserted or excluded from the circuit. So
depending on the country, it may or may not be there. If the diode is not
already there, then you are set, no need to snip. Interesting note, the
manual lists some countries where the speed mod diode is already removed.
I wonder if some countries are allowed to scan faster then others.....
Hmmmmm..... :)

The basic point it this: You should use the right tool for the job,
whether is it the "newest toy" or not. If you are using a repeater
channel, trunked or conventional, around the fireground, you are
using the wrong tool.

The connecter is soldered to a PC board. I would guess it is broken
off or a cold solder joint has finally given way. Most likly looking
near the connector you would find it so. Make sure your cable is ok
Most of the time the dc cables are cheep and wires brake inside.

: for
: >profit. I'm still curious (and skeptical) as to whether there is such
: an
: >exemption, and would like to have any pointers anyone can provide.

: Geez! You can read the ECPA until you are blue in the face...you won't
: find a thing about scanning for profit...you sure know your
: communication law!

Jeeez! Did I take you to raise? Did you not read what I took the trouble to post? Did it not make its way to your few surviving brain cells? At the risk of angering folks on this group by posting this again ...

" (c) It shall not be unlawful under this chapter for a person acting under color of law to intercept a wire, oral, or electronic communication, where such person is a party to the communication or one of the parties to the communication has given prior consent to such interception.
...
is not an offense under this subsection UNLESS THE CONDUCT IS FOR THE PURPOSES OF DIRECT OR INDIRECT COMMERCIAL ADVANTAGE OR PRIVATE FINANCIAL GAIN."

I even took the trouble to put the appropriate phrase in ALL-CAPS, oops, I forgot, that's an editors term and you probably don't understand it since you're not a _real_ (print) journalist, just tv talent (and I use that last word advisedly <g>). What does the phrase DIRECT ... COMMERCIAL ADVANTAGE suggest to you? Does the fact that I paraphased (sorry, another big word) it as 'financial gain' or 'scanning for profit' throw you off? I guess you have to have a direct quote, though god and WRHearst both know you're no good at quoting.

: Since I'm not the one all "twisted up" about the issue I will leave the
: leg work to you.

And you make my point yet again, weedhopper - you media pukes are too lazy to do any legwork. You could have verified in less than 5 minutes on the net whether I had the background to address this issue, but you just want to sit there and say I must not know how you gather news.

: Start by calling the U.S. Department of Justice and plead your "case"
: to them.

Yeah, right! Like I could take on the amorphous 'media'. Didn't someone say not to fight with folks that buy ink by the barrel (or electrons by the googol, to update it a bit).

: Who you gonna go after next...pager notification networks? They hear
: things on the scanner...beep you...and collect a monthly fee.

What the hell is a 'pager notification network'? Is that something some yahoo's dreamed up out there in La-La land? You guys so lazy you don't listen to your pagers and someone listens for you? Non mi capisco.

: WOW! Lawbreakers everywhere.

I just want you to admit that you could care less if you break it or not and that if you depend on the PD for your scanner codes, they're subject to being revoked if you piss of the PD. Try going to the DOJ and crying to them that the PD's being unfair to you 'cause they took your Moto Saber crypto codes away and see how far _you_ get. You need to get out of bed with your local government if you're going to report objectively on their activities (as if objectivity isn't a joke in your profession already!).

Try an experiment. Turn off all the scanners for a day and see how much timely news you get by sending reporters out at random and depending on viewers phone calls.

: Mr.News

I too, have a PRO-51. I purchaced 2 sets of NiCads and a 3-Hour
Charger that just charges 4 AA batteries. The first hour discharges
and the other two hours charge. I also get approx. 12 hours usage.
With 2 sets, I can almost fully discharge one set, replace with a
fresh set while the other set is charging. Works great for me. Also
purchased from Radio Shack.

>A lot of people on welfare today have a 'mental block' when it comes to working, but as
long
>as we keep giving them what they want, they just keep taking it. Seems the same is holding
>true for good ol' amateur radio.

Welfare is, usually, granted to those in need, who for financial, medical
or any other legitimate reason, is supplied by the state the resources
that it feels are sufficient to keep body and soul together (whether it
is sufficient, or is extravagant is another debate.) The funding for
welfare comes from the pockets of each one of us throught our municipal,
provincial (state), and federal taxes. If someone claims that welfare,
it is taking that money, indirectly, from my pocket. If the claim is
illigetimate, then that same pocket has been summarily emptied
illegimately.

But the code/no-code debate is not analaguous to me, the tax payer. In
fact, if Morse code test were abolished, perhaps my tax dollars would
decrease. No doubt, however, it would be incrementally small because it
would be more of an administrative savings, than actual. Surely there is
no doubt that if Morse code testing were abolished, there would be no
measurable increase in interference from amateur stations.

Therefore, the analogy that Morse code is a reflection of our supposedly
give-away times doesn't stand up to scrutiny because the abolition of
Morse code isn't "something for nothing", but the continuance of such
testing is "nothing for something".

>Doesn't really matter though, since all I have to do these
>days is shout 'hearing problem' and I get a code free...what?...Advanced or Extra? Why
>work?
>

As I understand it, in the U.S., a candidate can produce a medical
certificate attesting that the candidate is unable to take a Morse code
test due to a disability. I understand that this was undertaken in
accordance with equal access provisions of U.S. laws because it was felt

that the incapacity to write a Morse code test should not be a barrier to one being able up-grade to the highest level of amateur certification.

Regardless of the merits of such a provision, where it is viewed as amateur radio's contribution to affirmative action, it does seem to be a signal example of reverse discrimination, but not only that, but one could draw the conclusion that the U.S. government has determined that Morse code for higher certification is indeed superfluous. Those who have a disability have a means of upgrading their qualifications without Morse code testing beyond 5 words per minute, while those that are able=bodied must demonstrate their capabilities. If Morse code is not required by those that are handicapped, why is there the necessity for those who are not must take the test?

An irony that is almost pervers.

> *other.....

=====
I don't know what kind of "noise" you are receiving, but here are some
guesses:
If you live in an urban setting, there may be simply too much signal
going into the receiver. There are several ways to fix this. You can
go to Radio Shack (or your favorite place) and get an attenuator; this
will lowetr the signal strength into the receiver. You can install
an antenna specifically tuned tot he frequency band you are interested
in; this may mean several antennas on your roof!
An FM filter (such as Radio Shack sells) *may* help, and may not.
Close FM stations can be a real problem; their high power can cause
intermod (a *lot* of it!). Again, an antenna tuned to your favorite
frequency band will help here, too.
If the standard antenna works well, and all an external antenna does is
add "noise", maybe that standard antenna is better for your situation.

1952. Re: Cellular telephone frequencies

Newsgroup: rec.radio.scanner
Date: 1996-04-24 00:00:00 UTC
From: mulligan@ACM.ORG
Message-ID: <4llv92$apk@HOPPER.ACM.ORG>
Source record: 235368

reptile@goodnet.com (Mike) asked:
> ... a list of the exact cellular telephone frequencies?

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

Cellular Telephone [22.902]

Chs Freqs (base) System Use

800-832 869.040 - 870.000 A - RCC voice
1-312 870.030 - 879.360 A - RCC voice
313-333 879.390 - 879.990 A - RCC data
334-354 880.020 - 880.620 B - Telco data
355-666 880.650 - 889.980 B - Telco voice
667-716 890.010 - 891.480 A - RCC voice
717-799 891.510 - 893.970 B - Telco voice

Mobiles transmit 45 MHz below the base (824.040-848.970) and
are usually repeated by the base. Channels are 30 kHz apart.
Channels 800-832 are also identified as Chs 991-1023.

>listen to your pagers and someone listens for you? Non mi capisco.

A 'pager notification network' is a network where a whole lot of people who enjoy listening to scanners will call in and leave a voice mail at a central number. Dispatchers (or some other word to mean the same) get paged when a voice mail comes in. They listen, and determine if the 'incident' is worthy, and send it out over the digital paging network.

These networks are great if you're interested in what's going on, but you have to be away from the scanner.

>and half of them say it's perfectly legal while the other half say
>it's illegal.

Daron, yours is an appropriate question for this forum, in spite of any flames you may have recieved. As you probably have already found out, it depends upon where you live. (What State) I know that New York and Virginia are two States that illegally (in my opinion) restrict the use of scanners in vehicles. There are others with Ham caveates [sic] but I'm sure that there will be quite a response to your inquery. I would be glad to discuss this subject with you if you e-mail me at cheshire@ridgecrest.ca.us

Have a good one

This is very good advice, particularly if your radio has been "modded".
Most mods require the antenna to be de-soldered and reconnected. Also,
during this process, the surface mount cap on the underside of the PCB
can fall off if too much heat is applied.

If you want a "safe" 900 MHz phone, be sure it is a digital phone, and better yet, a spread spectrum digital phone, NOT an analog 900MHz phone! Many people assume that all 900MHz phones are digital, but there are some analog models as well, so be careful what you buy!

Your phone transmits on one frequency, call it freq A, and it receives on another frequency, call it freq B. If your talking on your cell phone, your voice is sent to the cell site over freq A. Only one side of the conversation can be heard on this freq (your side). The cell site receives your voice (on freq A) ,adds it to the voice signal of the person you have called, and transmits this signal on freq B. Now both sides of the conversation can be heard on freq B. Since your cell phone (and several scanners tuned in illegally) receives freq B, you hear both sides of the conversation. If your phone did this adding of voice signals instead of the cell site, you could not hear both sides of the conversation on the same freq.

Cordless phones operate the same way.

Hope this answered your question.

>teur.antenna). Antennas are magic!

As you know, Jeff, the problem isn't the discussion of antenna theory.
Our "new breed" of amateur radio operator is more likely to run down to
the local radio shack or call HRO to "order" their antenna. Their thinking
is "gee, with all these commercially available antennas, why would ANYONE
want to BUILD one?"

Yet another fine addition to amateur radio thanks to the no-code tech
class.

>Why in the world would you copyright your senseless post?

Considering all posts are automatically copyrighted in accordance with
the Berne Convention, of which is US is a signatory.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

To start with I want to thank everyone that responded to my question a few weeks ago "How would you do this ". I received some excellent advise that improved reception on most all freqs. My question is what would be the results of attaching multiple antennas to a single input? I have a coax harness that was designed to feed quad uhf beams, with 4 N-type male connectors at one end and a single female connector on the other end. I have seen antennas "co-phased" I believe is the term, on Ham radio systems. By attaching two or four antennas will I in effect double or quadruple the usable signals available to the radio? Would I need to use four of the same types of antennas? What would be the effects of mixing differant types of antennas ie: two discones & two beams? Thanks in advance for all your ideas and help.

I talked with a Seattle dealer about the DS8000 last summer. It's a circuit board that plugs internallly into the AR8000. Cost was about $99. It decodes simple speech inversion found in 46-49 Mhz cordless phones but does nothing for 900 Mhz digital and spread spectrum. In the mean time I found Ramsey Electronics had a standalone unit in its own case, 9v battery powered for about $80 assembled or $39 in kit form that can be plugged into any scanner. I didn't buy the DS8000 because of the cost difference and I wanted one to use on my other radios.

: mod as the 2006 (which it replaces at Radio Shack)?? I suppose I could
: just pop the case and look, but I was wondering if anyone knew for sure of
: any mods. Thanks in advance.

Nope, sorry. There's no diode in this one.

I had one of these for about 10 days before I took it back. If I
remember right, it can pick up cellular images quite clearly around
1105-1115Mhz. Cell images are a "feature" of modern scanners which tune
in large, unused bands above 1Ghz. There's no real signals up there, so
the slightly weakened images of lower bands come thru quite clearly. You
can probably hear all the cell calls you would want to just by tuning
them in in this range.

If you really want to mod the thing, you can send away for a CPU board
from Javiation in the UK (around $200), or get a Canadian Optoelectronics
OS565 computer interface (around $300-$400). But first ask youself if
it's really worth it.

All Note: I have no affiliation with or financial interest in the
below article. I am posting it as a service to those interested in
Extended Memory Modifications and a slick way of controlling that
memory. The "LinkAll" is a pretty wicked gizmo if I say so myself.

Bill Cheek

==========

NEW REDUCED LINKALL PRICE

We are pleased to announce that the prices for the now famous Linkall
series of extended memory controllers has been lowered by 30 percent.
The new prices for the Model 6 Linkall is now $60.00 and the Model 4
is now $55.00. The new prices are due to the tremendous response for
these units and the cost reductions resulting from volume buying of
parts for the Linkall.

This is the time to think about that new scanner with megamemory and a
Linkall to manage that memory in style. If you have a PRO-2035 or a
PRO-2042, please contact us for more information.

Installation is available for $50.00 which includes all parts and the
use of special 2mm tube type LEDs for that factory installed look of
excellence.

When ordering add $5.00 shipping for a total of $65.00 for the Model
6 and $60.00 for the Model 4 Linkall.

For more information on the Linkall, please contact:

Laws are only guide lines for smart people.

The law were I leave, restrictes every household to have only one
antenna, you can one FM, or one TV VHF, or one TVUHF, one DSS etc
etc. Does any body take this seriously ? The town library has dozens
of encyclopedias, more than one hundred telephone directories and so
on.... but we have the cable cable monopoly.

Oh... you thought that it was *possible* to remove a newsgroup from the
alt.* hierarchy? Look through it some time and see all the worthless
groups. If a newsadmin "rmgroup"s one, it just automagically comes back.

Welcome to Usenet.

Primarily in the VHF AM aeronautical band, from 108 to 136 MHz or so. For
your local frequencies, go to a library and get an AOPA Airport Directory;
look up local airports and use the frequencies listed there.

1985. Saturn 6 tuning - HELP!!

Newsgroup: rec.radio.scanner
Date: 1996-04-25 00:00:00 UTC
From: darryl.linkow@grinder.com
Message-ID: <8BF5288.01AE001EAD.uuout@grinder.com>
Source record: 235246

Hello all and thanks for reading this. I just acquired an old Saturn 6 antenna and am having a difficult time getting the SWR down below 2.5 to 1. I am using the MFJ-259 analyzer. I am just curious if perhaps part of the antenna is missing? There are two screws attached to a piece of phenolic board. I have attached the shield and center conductor of some RG-58 coax to these screws as the feedpoint. I am just curious if perhaps there is a tuning device (other than the capacitor plate adjustment) or a balun that should be connected to these screws on the phenolic board that might be missing? Also, might anyone have an instruction sheet or manual that came with the antenna that I might get a copy of? Any help would be appreciated.
73, Darryl KE6IHA

> I work for Sears Loss prevention, and we use general business radios.
> ... check these freqs ...

Whoops ... the listed frequencies belong to GMRS - General Mobile Radio Service, intended for the personal use of an individual and his/her family. Non-individuals with licenses issued before July 87 may renew them under certain conditions, but may not make any modifications (i.e. adding units, changing location, etc).

> The cost of getting frequency-specific radios, and also the licensing,
> would cost a fortune in Sears' eyes.

Now that it's been publicly announced, Sears may decide that the potential fine for unlicensed operation (multiplied by the number of sites nationwide) far exceeds the cost of proper licensing.

Mine was made in November of 93, and the 2,9, L/O didn't work when I just
turned it on, but it does in display test mode. All I had to do was hold
down 2,9,and L/O until it scrolled all the way across, then it had the
test #1 frequencys. Thanks

Try 122.8, 122.9, and 122.75. These should be fairly active. Also, stop
by a local airport and get a sectional chart of your area. That will show
the airports and the frequencies they use. Normally, private planes will
use the same frequencies that commercial aircraft use, because they are
talking to the same towers and atc stations. The difference is that they
also communicate with the small airports that have no commercial traffic.

You may not have to Mod the scanner. Look up the Intermediate Frequency
(usually in the back of the manual; for BearCats it's usually 2?.? Mhz.
If you 1) add that value to the freq you want to listen to
2) program the result into the radio, you may get away without risking
your radio.

>More than you'd think! Tow Truck companies, Mall Security, Utilities, Schools,
>Trucking Companies, Private Business, Churches, etc.

Actually, I spoke too soon. I finally got around to checking out the
PerCon WWW page and this is what it says about the "Spectrum Frequency
Database" CD-ROM:

The Database includes records for Police, Fire, Hospitals,
Businesses, State and Local Governments, Airlines, Utilities,
Hotels, Theme Parks, Taxis, Freight Companies, Phone
Companies, and much more. Frequencies range from DC to
Daylight.

So it does have government freqs, albeit not military or, appearantly,
federal freqs. If I don't happen to find it at the hamfest this
weekend, I might invest in it.

>But the code/no-code debate is not analaguous to me, the tax payer.

Amateur radio costs you, the taxpayer, every year. What percent of the
FCC's budget goes towards amateur-radio-related activities (applications,
monitoring, fining, etc?) Are not you, the American taxpayer, asked to
subsidize this cost every year, just as you are asked to subsidize the
welfare-state programs?

Furthermore, amateur radio consumes valuable spectrum that could be
sold. That money could reduce the deficit, and directly affect the
amount of taxes you will have to pay to finance the deficit and
national debt.

I merely stated a fact. It is no more unacceptable or impractical
than any other truth.

>Although you are entitled to your opinion, your attempt to drag me
>into a viewpoint that is unacceptable is uncalled for.

Whether you like it or not Jim, what I said is directly related to
your previous post. It is, in fact, the basis for the "perverse"
nature of the U.S. rules that you so clearly pointed out. Even a
cursory inspection reveals that socialism extracts a higher toll from
those who are capable than from those who aren't. You don't want to
accept the analogy, but it is absolutely appropriate and it explains
the mystery that you would prefer to leave undisclosed (and
undiscussed).

>Please desist.

This reminds me of an English couple I met a few years ago. First
they stated that Thatcher would be greatly offended by anyone who
called her a socialist. Then, in the same breath, they justified
their government's behaviour on the grounds that most people prefer
guardianship to freedom.

It takes some pretty tall boots to wade in on that side of the fence.

I may be wrong on this, but it seems to me the PubSaftey agencies don't need more spectrum for data, they need more speed. Most MDT type systems I've heard of don't transmit at more than 2500KBps, they could easily push that beyond 28.8KBps. My whole city has the "Ricochet" system that is a 900 MHz Spread Spectrum wireless modem, over 35 KBps speed and a raw data speed of 199 KBps is supposedly possible. Ricochet is charging $200 per modem, you think companies like Motorola could offer something a bit cheaper than their $8000+ MDT's.

Even more fun is when you have a programmable 2-way with CTCSS
capabilities to transmit out on the headset frequencies! Yeah, yeah, I
know -- it's highly illegal, but it makes for some great high-tech
mischief! More fun is when you have a good transmitter (25+ watts) and a
gain antenna -- you hit all the McD's on the same frequency pairs for
miles around!

I don't do that anymore - was a little prank I pulled as a kid once or
twice, but made for a shitload of laughs with the buddies in the car with
me!

Customer: Can I have a...
Me: NO!
Customer: Excuse me?
Me: Go away! We're closed!
Customer: <drives away>
McD's Manager on headset: CUT THAT OUT! NOW!! COME TO THE OFFICE!!
McD's Employee: B-b-but it wasn't me!!
Me: Suckers!

: leaves the receiver within the dish or VERY close to it.

: Long(er) lengths of coax are not as critical at 75MHz. Coax loss
: factors still apply but at 75MHz.

Nope, the signals are downcoverted from 11.7-12.2Ghz as transmitted from the satellite down to 950-1450Mhz by the LNB, the device in the feedhorn of the dish. The cable from the LNB to the dish carries 950-1450Mhz to the receiver, where it is downconverted to 75Mhz inside the receiver, then converted to baseband. Normally, the receiver is much closer to the televison than the dish.

>James

Commercial and private aircraft all use a common band of VHF
frequencies, 108 to 118 Mhz. That's the 10 Mhz just above the FM
broadcast band. You don't say where your from, but, if your listening
to approach/departure control or tower frequencies of a large
commercial airport, then most of what you hear will be commercial
aircraft. Most private aircraft (small recip engined, not corporate
jets) fly out of smaller surrounding airports. Find their tower
frequencies or UNICOM frequencies to hear them, although private
aircraft are under the control of the nearby major airport and use some
of their frequencies. To find frequencies used in your area, get a
copy of the Airport/Facility Directory from one of the flight services
companies at any airport. Their are 7 directories covering the US but
you'll only need the one for your area.

Regards,
Bob...

There is no such thing!.. The FCC (for you U.S. folks or DOC for us Canadians)
would never allow something like that.. think of the mass chaos that would cause
if you had a cordless phone that would go 500 miles. It is bad enough right now
as it is on a cordless phone with two people being on the same frequency.. 500
miles would be pure chaos.

2022. Pro-2026 Modifications

Newsgroup: rec.radio.scanner
Date: 1996-04-25 00:00:00 UTC
From: darkshad@phish.nether.net
Message-ID: <4lmqal$gi6@ocean.netrover.com>
Source record: 235283

PRO-2026

by David Humes KA2QZD

ALL INFORMATION IN THIS FILE IS FOR EDUCATIONAL PURPOSES ONLY !!!!!!!!

MODIFYING OR TAMPERING WITH THE SCANNERS'S INTERNAL COMPONENTS MIGHT INVALIDATE ANY WARRANTY OR VOID FCC ACCEPTANCE OF THE RECEIVER !

CELLULAR RESTORATION

It's easy open up the case and cut L201. L201 can be found on the control printed circuit board. This board has the 80 legged I.C. on it and is found just behind the front control panel. L201 is directly behind the scan key on the control board. It is on the opposite side from the microprocessor and is visible when the speaker side of the case is removed. I did not cut L201 because it looked special like an inductor in a UHF tank circuit but a little smaller, it's not just a plain wire jumper. And thus I will have the option of putting it back and it will look like it was never touched once the flux is removed. What I did was removed both halves of the case, removed the tape covering up the four screws that hold front panel to the chassis. Removing the four screws allowed me to unlatch and rotate the control assembly allowing me to unsolder L201 and resoldering only one side to the ground plane pad of the circuit board and left the other end of the jumper hang off the edge of the board. Then put it all back together.

OUT OF BAND SEARCH

One odd thing I noticed after the cellular mod was preformed was the out of band search ability. It's nothing major just odd. I do not know if it will work with a stock factory fresh unit, I did not put L201 back in to find out. Try programing 407.000 Mhz Hi search limit and 173.000 Mhz Lo search limit. After the limits are programed push scan or manual button then limit button then the down arrow, the unit will only work normally with the up arrow. My unit would search and receive (sensitivity was verified) down to 380.000 Mhz area. I think the VCO bottoms out at 380 Mhz and when the search got to 173.000 it did not start receiving again!, probably do to the unnatural access (a loophole in the software). It also worked with 807.000 Mhz Hi limit and 511.000 Lo limit. The search stopped at the first UHF T.V. station it received. Pushing the up or down arrow again will restore the search to "normal" operation. Thus if the search stops on a signal like a T.V. station pushing the down arrow will not let the search resume on the next incriminated frequency as you would expect, but resets to "normal" frequency limits and then resumes the search. If you have a PRO-2026

try this a few times.

MEMORY RETENTION TIME

Out of the box my unit would not maintain it's memory for more than an hour and a half with all power disconnected, I was not impressed! I could not find any published specification on memory retention time in the owner's manual or the service manual. I would recommend getting the service manual unless you know it will be of no use to you, it's under $10.00. The following problem may be repaired under warranty if you can prove the defect to RADIO SHACK without a spec. The scanner appears to be manufactured by UNIDEN and I am familiar with other UNIDEN and RADIO SHACK scanners and there memory retention circuits. After I received the service manual from RADIO SHACK I decided one and half hours was not acceptable. So I set out to find out why or modify the unit for better performance. Well both happened. I found C186 a 1000 ÂF cap. not electrically connected to the circuit. There was only 250 mV across it when 4.3 VDC should have been. The problem was the trace leading to the positive side of the cap. is on the component side of the board. Upon removing the cap. I found that the hole had not been plated through and was only soldered on the solder side of the board. This did not make the connection to the cap. thus the very short memory. There are a few other smaller caps. upstream providing some memory retention time. Resoldering the cap. may have corrected the problem, and increased the time to a minimum of a day or two to a week or so. Since I had the cap. out and had some parts to improve the time to an extremely long time I did. I left out the original C186 a 1000 ÂF 35 VDC (it is the largest cap. physically in the unit and is near the front on the main board behind the right hand side of the keypad). I installed a .47 F cap. yes a one half Farad cap. and a 470 ohm one half watt resistor in series with the positive lead for current limiting purpose. The current limiting is to protect the voltage regulator so the charge current into a discharged .47 F cap. will not exceed the regulators current specification. The 470 ohm resistor should have a very minimal effect on memory retention time. The .47 F cap. is about the size of three nickels stacked on top of each other not including the leads. The cap. was secured to the inside of the chassis using G.E. Silicone II Glue, Seal & Gasket. securing the cap. should eliminate any future solder connection failures do to the mobile environment. This cap. and other similar values are available from DIGI-KEY corp. part number P6954 Phone 1-800-344-4539.

OTHER NOTES

The PRO-2026 that I have seemed to meet all published specifications and in general works well. I am also thinking of trying to speed up the scanner by replacing the 800 Khz resonator with a 1.000 Mhz or a 1.8432 Mhz or maybe 2.000 Mhz crystal !!

2026. Private aircraft freqs?

Newsgroup: rec.radio.scanner
Date: 1996-04-25 00:00:00 UTC
From: luvautm@vnet.net
Message-ID: <luvautm.98.317EC68B@vnet.net>
Source record: 235305

Hello All,
I have programmed all the local commercial aircraft freqs for my area into my scanner and enjoy listening to them quite often. However, even that gets old after a while. I was just wondering, what frequencies do private aircraft operate on? I'm assuming that they're in the HF range. If I'm incorrect then what bands do they operate on? Any info will be greatly appreciated. Thanx!

I'm looking for 10-Codes for Baton Rouge, LA police and East Baton Rouge Parish sherrif's department. I have compiled a short list, but I am missing some of the codes. They do not seem to follow the APCO standard (or not totally).

Also, I was told by a police officer (by way of a friend) that giving out the codes is illegal. Is this true or does it depend upon local laws?

Hi Mickey,

The short answer is, yes, multiple antennas, properly connected, will
improve your signal.

The long answer is, how the antennas are mounted, how they are
connected, etc. makes a big difference. It's complicated.
The ARRL antenna manual covers this in detail, and it's a lot to take
in.
I have had good luck in building vertical arrays using dipoles, you
mount three or four of them on a vertical boom, each one a wavelength
apart, and connect them in parallel with equal length pieces of line.
I'm not expert enough to know if I'm doing this the best way, but what
I have done works better than the single-element antennas I have. On
UHF and 800 Mhz, the whole arrangement is still small enough to mount
easily.

There hasn't been much discussion here about antennas for 800 Mhz.
A good antenna makes a big difference.
Perhaps someone could provide some more sophisticated suggestions?

Regards
Paul

>design. Two quad op-amp chips should do the job.

Not really,,, 200 milli volts peek to peek is the ideal input
voltage.

Problem is the greater the voltage the greater the bandwidth I've
found.

PL tones are only about 10 or 20 percent of the amplitude of the voice
and because of that even using two stage op-amp as a low pass filter
not enough attenuation can be had.
(not narrow enough)

The 567 is a very unstable chip. Depending on a RC circuit for its
time base makes it a bad choice.

Also the 567 I found that 1.5uf cap and about 500 M ohm in the RC
circuit is the highest you can use without it going into self
oscillation. If you do the math and I'm correct then It can not be
set to decode a frequency lower then 60 hz.

The tone I"m stuck trying to work with is at 30 hz.

>You want to pay attention to the bandwidth or lock range you set the 567 up for.
>You'll need to set it wider if you want the thing to lock on any freq in
>the band; then set the freerunning freq to the middle of the band and the
>filter should center there also.
>In this setup you can read the 567's oscillator with a cheap counter.
>Reading the 567's oscillator gives you a clean tone, locked to the PL from
>the signal, but without all the voice included to confuse the counter.

> For detecting individual PL freqs you can make the lock range narrower &
>put the free-run freq equal to the target freq.

Do you mean to say that I can create my own clock instead of using the
normally used RC circuit?

>You may well find that you can make the 567 lock on that data burst if you try.

Falses on audio. Also GE tones are very unstable so if I increase the
bandwith the 567 falses on audio.

>Good luck.
>-- Chuck

I need more then luck..I need a better low pass filter. Detecting the frequency is easy.

Lets keep the ideas going .....

I suspect it would be possible, but I'm not sure it would be practical.
I recently bought the POCSAG (pager) Decoder software and built the
interface to plug into a scanner. On a typical weekday, there seems
to be about 2-3 MB (yes - megabytes) of data. Given that most pagers
can only store a couple of KB, I suspect that, during heavy use periods,
it would probably take less than 60 seconds to fill the pager.

>
In Canada, specific frequencies, or bands, are not typically reserved
for one type of service. What might be a police frequency in one part
of the province, might be used by logging trucks somewhere else in the
province. Therefore, I suspect the Band/State search function
would not include Ontario.

Actually, it can be quite entertaining. Trying to figure out who goes
with what, what the 'secret' codes mean, and so on. Sorting messages
by cap code or message, and then cross refrencing them can reveal things
that would never be broadcast over a voice channel. I guess pager users
still consider them to be secure, the same way VHF voice users did before
scanners became common.

Hi James,

Most general aviation (private) aircraft operate on the same frequencies as the airlines. The reason for this is that they are talking to the same people, air traffic controllers. One difference though is that they frequently operate out of smaller airports and often the conversations are more relaxed. You might try looking for signals in the area of 122 - 123 Mhz. This is where most of the unicom frequencies (those used a small airports) are found. If you are near to a large airport, you might listen to 121.6 - 122.0 for ground control freqs. These are used to direct A/C traffic while taxiing at the airport. If you leave me a message telling the vicinity where you live, I will try to give you more specific frequencies.

Hope this helps. Oh, one more thing, 121.5 is the guard or emergency frequency. Any traffic you here on this freq. should be regarding a distress situation. Also, if you here a warbling tone on this freq., it is an ELT (emergency locator transmitter) on some aircraft that has been triggered. Most of these are false alarms, but you never know! After an ELT is detected by the SARSAT satellite, the USAF tasks the Civil Air Patrol to go find it.

Why bother with TDMA? I was talking with a cell phone dealer today and
he says TDMA is all but dead. The sound quality is atrocious and the
phones work so bad all people do is take them back. Then Motorola sends
them nasty letters admonishing them for not using the phones properly.
The guy said the last time someone came in and asked for digital phones,
it's because they were bookies and they had been busted before from
someone picking up their calls and they wanted to keep their conversations
private. But he also said that no normal person wants a digital (TDMA)
phone cause they are bad, bad, and he steers them away from them like the
plague. He also pointed over to the Radio Shack and said "anyone can buy
a scanner over there which picks up regular cell phones" as long as they
know what frequency to tune in to they can listen to anyone.

They take that magic diode out before they ship them to the Netherlands.
People in the US have a strange obsession with scanners which have that
diode in them just so they can cut it out.

Ron;

Is it like the Etobicoke system was when it first started up? Maybe routine ops are restricted to one set of freqs in the trunking system (eg the last three of 10 etc) which are also shared with other users, but when there is a fire event, those three freqs are locked out of the system and allocated only to fire?

Who are you to say what a reasonable price is for anything?
If you dont want to buy it at the price the owner wants to sell it for
DONT! but dont tell him that the value he has placed on the objects he
owns are wrong!
We live in a free enterprise society, people pay for Items according
to the value THEY set for them, not basd on the value you set. Only
you determine the value You set!
Look around you, Identical models of new scanners go for different
prices at different stores..is the most expensive store wrong in their
pricing? No they are simply not competitive based on the single issue
of price! perhapps they add a matter of warrantee or convenience that
makes their price attractive to some consumers.
Reguardless of that discussion however, the price requested for a used
article is set by by the seller. The simple fact that the item is
'old' does not mean its worthless. A 1963 corvette is not worthless..
if well maintained it is worth more than a 1996 Vette! You wouldn't
say that the value of the older car should be lower because of the
availability of a new vette..why would you think that saying that a
new chevy baretta costs less would make any difference in the value of
the '63 vette.
The 2006 scanner is prized by many hobbyists. For that reason alone it
commands a higher value reguardless of what price radio shack charges
for any of its more recent junk!
If you dont like the price someone is asking just dont buy it!

Anthony,

Just a few observations...

>cardenas@kaiwan.com (Anthony O. Cardenas) wrote:

>As I understand it, those 800MHz channels are in use now by LAPD
>Traffic Control officers.

The "Traffic Control Officers" you speak of are civilan employees of the City's Department of Transportation, and are not members of the Police Department.

>While LAPD does access a lot of data, they would not require that many
>channels just for data....

While I certainly DO NOT speak for the LAPD, I can say that the L.A. Fire Department is currently wondering if its six UHF-T data channels will be sufficient to handle operations in the coming years.

>Most data, even for larger cities is done on
>one or two channels with ease and without overload.

Anthony, I would love to find out how these "large cities" do it!

> When one thinks
>about it, a field officer requires just a few lines of data most of
>the time. On occasion he/she may receive a page or two if the suspect
>has a long history.

Much is changing in Public Safety. With AVL becoming more common and NCIC 2000 (remote fingerprint ID) just around the corner, there will be a tremendous increase in data transmissions, especially in larger cities.

>... Again, clear indications that LAPD will not
>require that many channels just for data.

Again Anthony, I don't speak for LAPD, but I wouldn't be too quick to discount the ever-growing needs for that agency to move large amounts of data.

Brian Humphrey
Public Information Officer
Los Angeles City Fire Department

The following is a list of PSP barracks and the frequencies they operate on.

Channel A 155.580 Base/154.950 Mobile

Lamar, Clinton Co. Shamokin, Northumberland Co.
Trevose, Bucks Co. Selinsgrove, Snyder Co.
Coudersport, Potter Co. Somerset, Somerset Co.

Channel B 155.670 Base/155.910 Mobile

Foglesville, Lehigh Co. Fernridge, Monroe Co.
Philadelphia, Philadelphia Co. Avondale, Chester Co.
Danville, Montour Co. Milton, Northumberland Co.
Bloomsburg, Columbia Co. Milesburg, Centre Co.
Limerick, Montgomery Co. Ephrata, Lancaster Co.
Harrisburg, Dauphin Co. Swiftwater, Monroe Co.
Clearfield, Clearfield Co. Chambersburg, Franklin Co.

Channel C 155.505 Base/155.850 Mobile

Media, Delaware Co. Frackville, Schuylkill Co.
Phillipsburg, Centre Co. Rockview, Centre Co.
Dublin, Bucks Co. Schuylkill Haven, Schuylkill Co.
York, York Co. Hamburg, Berks Co.
Jonestown, Lebanon Co. ??? Bedford, Bedford Co.

Channel D 154.665 Base/ 158.910 Mobile

Montoursville, Lycoming Co.
Carlisle, Cumberland Co. (mobile units can be heard on both B & M freqs.)
Ebensburg, Cambria Co.

Channel E 154.695 Base/156.150 Mobile ????
---
all barracks listed here have base and mobile comms. on 154.695 only
^^
Reading, Berks Co.
Hollidaysburg, Blair Co.

Channel F 154.920 Base/154.830 Mobile

Lewistown, Mifflin Co.

Channel G 155.445/???.??? Mobile
---
all barracks listed here have base and mobile comms. on 155.445 only

^^

Embreeville, Chester Co.
Newport, Perry Co.
Huntingdon, Huntingdon Co.

Turnpike F1---159.075 F2---159.045

These barracks are located along the turnpike proper, along with
maint. buildings. Other locations are maint. sheds only.

King of Prussia, Montgomery Co. (Police and Maint.) East-West Pike
Bowmansville, Lancaster Co. (" " ") " " "
Newville, Cumberland Co. (" " ") " " "
Somerset, Somerset Co. (" " ") " " "

Pocono, Carbon Co. (" " ") Northeast Extension

This list is in no way exhaustive. In fact, I work on it every
time I travel. Any additions are very welcome.
Other frequencies that are definitely used include the following:

154.755---mobile to mobile
155.460---TAC-1
155.475---National (used to contact local PD's by radio...other times they
will use the County dispatch, as here in Clinton Co.
where I go to school. In Delaware Co. and the Philly
area, they notify local PD's by phone.)
155.490---PA Regional net "CLEAN"
158.760---listed as Liquor Control Units or Administrative use in various
sources. I have heard it used in Harrisburg as a car to car
private channel like the TAC-1 channel.

Please e-mail additions to brussell@falcon.lhup.edu (in .sig below)

Hi Tim. There are a number of proposed mods in the Jan 96/Dec 95 issue
of US Scanner News (USSN) They have a web page. They discuss a
different filter mod (to reduce audio clipping) as well as changing from
a ceramic resonator to a crystal resonator. I wrote up a few things,
and will try to send you a copy. USSN also has a good US band plan to
upload to the AR8000, but that does require a computer, computer program
, and interface. Scancat Gold can restore missing frequencies.
Hope this helps!

>You could fill a library with books whose sole topic is antenna theory.
>Heck, we even have an entire newsgroup devoted to antennas (rec.radio.ama-
>teur.antenna). Antennas are magic!

i've built a few. they ARE fun to play around with. but i have the
sneaking suspicion that building an antenna is a ham's way of doing
some little project that is a little easier than homebrewing equipment.
that's ok, but i hate to see so many people intimidated by the newer
technologies. you still can build your own transceiver but i don't
think many people do.

Units made since 1994 and sold in the U.S. have the CPU coded
so that the wire is ignored. It's missing because it doesn't
have any effect anyway. You can't restore cellular coverage
on the new units.

No, but a practical knowledge test on networking wouldn't be out of the
question, now, would it ? The proper operation of a packet station,(which
is required) the installation of a tnc and software, and general computer
knowledge wouldn't be too much to ask, now would it ? You need to know
baud reqs, bw, and other things in order to obtain your amateur ticket to
use packet on 30+ bands, so why not make the reqs a little steeper for
that. Don't you feel that you had to learn anything in order to operate
your own packet station ? Does that separate you from the crowd on inet,
because you have or can obtain special privs other people don't have, like
use of amprnet ? Have you ever run a tcpip node hookup to the inet, and
retransmitted amateur radio sigs to a commercial carrier, and vica-versa?
That's a very special priveledge, something no other class of computer
operators have, outside of commercial. And lastly, did rs-232 just float
up there on it's own, or did someone have to pay for it, and then build
it, and launch it, and make trajectory calculations for it, and write
compter tracking software, and packet progs, just so us tech and tech+
types could hook up our computers to it, and use their equipment, and it's
limited resources ? I don't know about anyone else, but I can't name any
other hobby in existence that would do this for us, especially when
there's no real money involved. Have a good day. 73.

The DPC 550 is analog though, which is the point that was being made.
I think the DPC's fool a lot of folks beacuse they say "Digital Pocket
Communicator".

It is up to the VE team giving the session as to whether they want to use the standard test or a multiple
choice test. Our group debated this for quite a while. (Questions like "group so-an-so one town over is using
the multiple choice test, why aren't you?)

I found it interesting how many people failed the test miserably on the questions, but passed with 1 minute
solid copy.

I forgot to mention that the unit has a push button toggle and a volume control on the front. The push botton is normally out, allowing the unit to bypass the incoming audio directly to the speaker. Pushing the button in connects the power to the unit and inserts the decoding circuitry between the audio coming from the scrambler and the units speaker.

I'll put the BC3000XLT against anything that Radio Shack has, including the PRO43. However .... my Uniden woes are ongoing. Here is my sad story :-)

I purchased a BC3000XLT from HRO (call Eric at the Burbank store - good deals) last May. From it's S/N, I'm guessing it was one of the first 1500 produced. The ROM version is "USA 0.20".

To say that it is a great radio is not an exaggeration. Sensitivity on all bands is great, and is a huge improvement over my BC200XLT on 800. The features are abundant (cut & paste, selectable attenuator, lockout on search, etc, etc).

There are a few problems, however. Some are design flaws, some are firmware bugs, and some, sadly, are Customer "Service" related.

Here is my description of the problems (YMMV!):

1) The BC3000XLT has about half the audio of my BC200XLT, despite what I said in a _Scanner Journal_ review last year. It's fine at home. In the car I have to use an adapter designed to allow use of a CD player with the FM radio. Not many fires here, but I imagine I'd have trouble hearing it at a fire. (Design)

2) I pickup images 910 kHz (2x IF???) from the fundamental on at least VHF hi and UHF. Note that my local FD frequency is 154.43 and EMS->ED is on 155.34 - you do the math! (Design)

3) Priority is non-functional when certain channels and banks are used. I.e. if I select 8, 11, or 18 as priority AND bank 2 is selected, the following occurs. A signal is received on the priority channel, the radio stops, when the squelch closes, the channel number display has a hissy fit and the last frequency received stays on the display rather than the scrolling SCAN. That will be the last signal it receives until you intervene. (Firmware)

4) The unit cannot be placed in AM mode above the 550/760 MHz gap, contrary to specs (manual, p37). (Firmware)

5) Frequencies with 12.5 kHz spacing in the VHF band (like, say, everything between 162 and 174!) cannot be entered directly. I did discover that if you change the step *before* entering the frequency, it

will store. (Firmware)

So, realizing that the unit would go out of warranty soon (May 12), I called Uniden in March. I asked the CSR about problems 2-5 (problem #1 is a lost cause), and he said "oh yeah, send it in". I sent it on 3/27 and it was received on 4/1. The unit was shipped back on 4/10 and I received it on 4/16.

COD.

For $11.01. Yes, it's still under warranty.

What did I get for my $7.50 Parts-and-Labor and $3.51 Shipping-and-Handling? Well, all 400 memories were erased. I also got a note that said:

"THIS UNIT HAS BEEN THOROUGHLY TESTED. IF YOU EXPERIENCE FURTHER DIFFICULTY, PLEASE CALL 800-297-1023 BEFORE YOU RETURN THE UNIT. UNIT PERFORMS TO FACTORY SPECIFICATIONS."

As soon as I read that, I knew I had been duped. The next day, I tried to call the 800 number and got nowhere. I finally call the regular number and was passed to the voicemail box of a "supervisor". She never returned my call.

The next day, I called and demanded to speak to a human. Vmailbox after vmailbox (I finally figured out that pressing 0 got you the operator again). Finally, I guess the switchboard got fed up with me because she put me through to a human. It wasn't a supervisor. I explained my problem to the CSR and she tried to help me. "It's not supposed to do AM above 760 MHz." "Oh, it's normal to hear transmissions on another frequency when they're so close."

In short, total BS. I explained to her that her answers might work had this been my first scanner, but since this was my fifth Bearcat, she'd have to do better.

I demanded to speak to a supervisor. I was put through to a Dan Fisher. He listened patiently to my story. He apologized and said he would send a UPS call ticket and would have the shop "take another look at the radio".

Well, that was last week. As of 1006 CDT on 4/26/96, UPS has no record of a call ticket in the pipe.

I like the radio. Except for the aforementioned problems, it performs well. Most of the problems would be fixed by replacing the ROM. Some will have to wait until the BC3500XLT. The main problem is with their customer "service".

I'll post an update when I get the radio back the next time. In the meantime, think hard about buying Uniden products.

Richard,

The "radios" are actually cell phones. They operate on the standard cellular freqs.

I can't recall the exact coverage. It was the base model for the
200xlt which is a fine piece of gear.

As for the price, I just saw one yesterday in a pawn shop for $65. It
had manual, battery, charger, stock antenna, and leather carrying
case. It looked to be in fairly good cosmetic condition.

Hope this helps.

> Try one near you!

On a transmitter a mismatched cable will have the effect of detuning
the output circuit of the final stage and consequently will afect the
output power of your unit. It may even increase the output power but
probably not for very long, since you may overload the output stage.

Since the input stages of a receiver are not really tuned the efect
is of lesser consequencies. But remember the matching trimmer that
many car receivers have for the FM band ? It does make a diference
when you turn that screw

I have a problem with my nicad batteries on my ar1000 scanner.

Whenever I charge them they only last about a quarter of the time that they used to. I believe it is to do with the nicad memory effect.

How can I fix them? I dont know much about electronics so it would have to simple.

Many thanks

Matthew

>advance for all your ideas and help.
>
Hello,
Not only will the antennas have to be all the same, they will have
to match the frequency the harness was cut for. Usually they are cut for
a narrow frequency band. If you try to hook on the type of antennas you
have in mind you will get some very unpredictable results, thats if it
works at all !!

Have fun.

Unfortunately, according to the Supremes we do have such a contract,
and it is enforced by the IRS, backed by the full weight of the Federal
government's armed might. Now we can renounce the contract by renouncing
our citizenship, as some have done, and adopt a flag of convienence instead,
but then we lose the benefit of the social contract, including giving up
the right to be in this country for more than 120 days a year.

I have got a "super sensitive" scanner. In fact it's so sensitive that I
have removed the antenna, and it's not missed by the receiver. Go figure.

Are there any cities that switched back to a regular unscrambled radio system after the citizens protested?

Our city recently switched to a digital/scrambled 800 Mhz system. Their logic was that criminals won't be able to listen either. This may be true bue when I asked them for the statistics to prove this - they can't produce any.

The police don't like it because they used to receive help from scanner owners who would hear something going on in their neighborhood and would call police and give them more information. Another problem is that Motorola still hasn't worked out all the problems with the radio system.

Since the people paid for the radio system - shouldn't we have the right to listen to at least some of the radio traffic?

Please E-mail me directly.

Thanks...Tom

Perhaps what you want is an RF downconverter...several are made that will go
between your antenna and the BNC jack...slightly bulky, but, it works every
time! Freqs are converted to 450 Mhz band.

The Ramsey box needs a 9 v transistor battery or battery eliminator for power, an external 4 or 8 ohm speaker and a audio cable to connect between the phono input connector to the external speaker jack on your scanner.

I am looking for others with ScanStar formatted program files for use
in the Ar8000. Western U.S. area for now.
This would allow me to quickly download "other" frequencies into the
Ar8000 which hopefully would be of use in "other" cities I travel to
often.
I can use ScanStar Dos or Windows files as I have both ScanStar
versions.(and yes ! ScanStar does blow away the competition).

If interested I have a few ScanStar programs for the Ar8000 for the Los
Angeles and San Bernardino areas. 1000 programmed Fed and State freqs.
with the alpha-numerics.20 banks of 50 channels laid out nicely.

**** Lets exchange ScanStar files out there!!! *****

Orange county got them first, then L.A. county, now you guys.
They are solar powered cell phones, that are set up to dial one magic
number when you punch the red button. The cellular provider has
his system set up so that the units can only dial that number - one
was cloned up here a couple years ago and ran up a $3k bill...

Nice box???? yeah, for the FBI! (using your tax dollars)....
You might want to get two good receivers with rs232 interfaces and
write your own code like I did.

<MASSIVE SNIPs>

>Why bother with TDMA? I was talking with a cell phone dealer today
>and he says TDMA is all but dead.

really? does he know anything about PCS and GSM? he IS a salesman,
you know; not an engineer...
TDMA is doing fine in those areas, and they're the developing ones -
it's CDMA that's having real problems. Tracking TDMA requires
receiving and interpreting address blocks in near-real-time. Tricky,
but cellfones do it. Modify a cellfone as a general receiver? Never!
It might be illegal....

> HD> radio related technical journals.

> BB> Which journals? Published dates? Name or articles?
> BB> I have written a number of articles for the Two Way field magazines,
> BB> and not ashamed of stating which issue, etc. Will you do the same?

Hahaha ! Why would I be ashamed ? I'm no Egdar Allen Poe but the articles
I did must have been good enough for the publishers to put them into print.
As usual, Bill attempted to defame and challenge, so the above statement
was my reply.

So..sure !! Uhm...off the top of my head...
QEX (ARRL's technical journal) November 95
TCA (The Canadian Amateur) August 94, December 95

Send me an SAE with a couple of stamps inside and I'd gladly send you
copies of whatever I have lying around ! (This applies to everyone.)

And your technical articles ?
I see you only quoted a small portion of the message...
So you've designed, built and programmed your own scanner interface,
infrared remote controls for scanners ect. among many other projects !?
You know what...don't bother replying...I probably know the answer and
I really don't want to continue this tit-for-tat challenge game.

> HD> Go back to FIDOland {Bill Cheek} and we'll all be happy !

> BB> I suspect you speak only for a vocal minority.

I really only speak for myself Blake but according to past feedback
to my original post, it seems lots of others would agree ! Apparently
Bill has left quite a trail dead soldiers in his wake.

> BB> Can you respond to my message without the flaming you like so much
> BB> to do, as you did to me in the FIDO echo? I certainly hope so, as
> BB> I have taken pains to be civil to you here.
> BB>
> BB> |Fidonet: Blake Bowers 1:3821/7
> BB> |Internet: Blake.Bowers@3821-7.woodybbs.com

Huh ??? I have flamed you on FIDO ??? When ? What was the issue(s) ?
And I have absolutely no reason to flame you now in fact, the "More
Bill Cheek Antics" issue has been dead for a couple of weeks now.
From what hole did you climb out of ? Sounds to me like YOU are trying

to stir the pot here.

I admit that I was out of line "flaming" Bill re: the FIDO issue here on the Internet Newsgroup but it was a spur of the moment release of anger and to those whom I have offended here, I apologize. (I had already done so to a couple of folks via e-mail exchange).
Notwhithstanding my expression of concern about the issues in my original "Cheek antics" post, I remained civil about the whole thing but of course Willy shows up and out comes the verbal nonsense for which he has become infamous (and doing more harm to his reputation and business).
Hopefully Bill will do his thing on Fido and keep his temper over there and I will do the same here !
I really don't wish to keep this issue alive. If you want to challenge my technical claims could you do me a favour and catch me via e-mail !?
I have nothing to hide...I just want to spare everyone else.

Thanks... hduff@humnet.humberc.on.ca

> them up?

Carl, the frequencies are as follows:

849 to 851 MHz Ground Station Uplinks
894 to 896 Mhz Air to Ground

The lowest Air to ground channel is 894.0055 Mhz, and spacing is 6 Khz.

They are AM mode!

What's the status of trunked systems along the northeast to central Florida coasts? We'll be travelling the back roads in late June and early July and I'd like to check in with local broadcasts.

Also, do the beach patrols use scan-able frequencies? Can anyone provide lists for the counties and/or towns down the coast from Amelia Island, skip Jax (it's in the books), through St Augustine, Flagler, Volusia County (actually it's in the books, too, but no beach stuff)?

I have checked the usual Web lists at percon and shadownet, btw.

Thanks, in advance.

>cursory inspection reveals that socialism extracts a higher toll from
>those who are capable than from those who aren't.

Oh really, based on what facts? A cursory examination of the rampant
neo-conservative views and the application of which seem to be prevelant
in your country would indicate otherwise. For example, examine the the
mortality rate of births in the U.S. I understand that the infant
mortality rate in the US is now higher than in certain Third World
nations. Hardly an endorsement of aggresive free market principles.
Unless, of course, it is your government's policy to have such a high
infant mortality rate resulting in less welfare later on? I have my
doubts.

By the way, you may not indeed have a written contract, but there is
a social contract between the government and its electorate. Part
of that social contract is that the state undertakes to protect the
individual from the those who do not wish to abide by the norms and
standards for a decent life. The punishment for failure to follow
these norms and standards, is the law. I understand that the U.S.
has the highest incarcertation rate of any nation in the western

world, so much so that I heard recently that your country is building one prison per week. Yet, when the backgrounds of most of these inmates are examined, you find that there are common threads of their lives... poverty, violence, drugs, crime. Now, I do not believe that welfare will solve all those problems, because no one answer is the cure, but it would seem to me that it would be more cost effective to have welfare to mitigate these vices, than to spend even more money to house these individuals in these universities of crime and depravity.

If you don't wish to be taxed in order to help your fellow man, Jack, you have every right to campaign for that. But the social costs that you will pay down the road will be far greater. Pay me now, or pay even more, as the man once said.

>You don't want to

Yeah, he was a salesman, so what. Just because he said that only 2% of cellphones in use are TDMA, and that TDMA has lots of problems like rotten sound and broken phones, and besides, most of the time TDMA phones fall back on AMPS anyway. He also said that the only way to get TDMA to work is put only THREE conversations on one channel, not the six it was supposedly designed for. If you know so much, tell me how many calls per channel TDMA and CDMA are supposed to have. And are they supposed to sound better than AMPS? And with only 3 calls per channel TDMA sounds rotten anyway. He would have earned himself a BIGGER commission had he sold me a digital phone anyway, what motivation would he have had to lie to me.

I just bought a used Bearcat 101 scanner at a garage sale (for $2!!!).

It works fine but I have some VERY BASIC questions about its use.

Is this model 'programmable'. It has 16 toggle switches for different
frequencies and also 2 buttons which are labelled (I think, the
scanners at home and I'm at work) PROGRAM and ENTER.Can I somehow
specify the frequencies I want to scan?

Also, maybe a real dumb question but, there is no on/off power switch.
Are most scanners meant to be left on all the time? Is there any fire
hazard (overheading, short-circiut) from leaving it on all the time?

Thanks in advance for any info you can provide.

Regards,
Jim

>

Indeed I am not an American taxpayer, thank heavens. Therefore, I do not care one iota what the FCC spends on amateur radio related activities.

I commend Deignan's very skillful job of quoting out of context, such an honour is reserved for the chosen few, no doubt. For those who cannot read the former post, it was in response to Robert's view the the abolition of Morse code is akin to the supposed "I want something for nothing" denigrations, making the parallel to those who are on welfare. I replied concerning the basis of welfare was one of need and want, but that the basis for welfare was not analogous to reasons for the abolition of Morse code. I accept that my taxes go to the government for the purposes of supporting welfare programs, the regulation of amateur radio, police and fire services, education programs as well as an armed forces and a health care program. Otherwise, we would not be able to live in a civil society. Perhaps you might resent welfare, and to a certain extent, so do I, but considering the benefits that I accrue, a relatively crime-free environment, where one can walk down the streets at night, a long life span, freedom to live where I want, the priceis small. Thus, I accept that I have a civil duty to contribute to the welfare of my fellow human beings through my taxes. No doubt, if there is waste and wanton expenditure, it should be eradicated.

If others believe that all welfare recipients are cheats and milking the system, they are most welcome to reform it. In fact, you have every right to abolish it, but you will do so at your peril in the overburening social costs.

>Furthermore, amateur radio consumes valuable spectrum that could be
>sold. That money could reduce the deficit, and directly affect the
>amount of taxes you will have to pay to finance the deficit and
>national debt.

>

How that relates to my previous posting is lost on me, but in any case, I am not aware that the FCC is undertaking to "sell" the amateur service spectrum. I suspect that they would not do so because of the international implications inherent for such undertakings. But if anyone has any further evidence of this is indeed being considered, please send me an e-mail.

Since they are cellular, they may change channels during a call, but not
likely. However they are likely to use different frequencies for each
call since they would use what is available from the nearby cell site(s).

>They are AM mode!

The 800 MHz channels are allocated to commercial air airline systems. There are also "Air-ground Radiotelephone Service" frequencies allocated for general aviation systems (private aircraft) in the 450 Mhz band.

The ground stations transmit from 454.675 to 454.975. There are 13 channels spaced at 25 KHz. The mobiles (aircraft) transmit 5 MHz above that on 459.675 to 459.975.

The range at which you can recieve them will vary depending on where you are and how the system is being used. The ground stations in the general aviation systems transmit at between 50 and 100 watts. The mobiles transmit at 4 to 25 watts. On the 800 Mhz system the power is controlled to acheive a certain receive level at the ground station.

I have never tried to listen to any of these so can't tell you what "mode" they use. By regulation, either system (general and commercial) can use any type of modulation as long as they stay within bandwidth tolerances.

Oh yeah. Also never checked on this.... since this is common carrier, it's probably covered by the ECPA. Gee wiz.

2120. Why want Cell Freqs??

Newsgroup: rec.radio.scanner
Date: 1996-04-26 00:00:00 UTC
From: pfyearwo@indy.net
Message-ID: <4lr42k$3it@news.indy.net>
Source record: 235227

With the problems inherent to trunk frequencies in the 800MHz band, why would some one want to listen to cell phones? The car phones I've heard on the older sets were very boring. Cell phones would jump from sell to cell making monitoring haphazard if not immpossible. The technology to make sense of a short call is beyound the reach of anyone but a government agency, like NSA. I would be interested in why people want this capability other then it is forbidden by federal law, thie the forbidden fruit syndrone. Thanks for your input. Paul

Want Frequencies for Little Rock,Ark.

Will be in Little Rock,Ark. & want to listen to Public Safety stuff.

Need freq's for the following:

Police
Fire
Rescue
Ems
Ham
Railroad
etc

Please reply to jtann@tcomeng.com

Tnx

Jerry T.

Hard to track?
Depends on the system, and if the user is moving from cell to cell.
Even so, not quite NSA level of difficulty.

Boring to listen too?
Depends on who's talking and what they are talking about!

Tell me I can't have it, so now I want it (Forbidden Fruit Syndrome)?
Definitely!

My opinion:

If you can send an RF signal through my body (I feel an invasion of
privacy here!), I should be able to tune it in if I want too!

I'm not sure if Marc's posting is serious or sarcastic but Bill has the
right idea. The mismatch is not important. What is important is to use
low loss coax and a good antenna as high as you can put it.

It sounds like you have an older scanner that uses crystals. If you look there should be a door or a cover that you can remove to get to them. The 16 switches are for choosing which frequency you want to listen to. Also, most scanners don't have an on/off switch, but if you turn the volume all of the way down, it turns off. Hope this helps!

From: slwork@netcom.com
Message-ID: <slworkDqH8Dz.Azu@netcom.com>
Source record: 235236

One way to "break" this type of scrambling is just to tune in a long-winded cordless phone user and listen for a while. After a few hours of listening to inverted speech, it starts to make sense. Back in WWII, this technique was used for secure communication. It was defeated by simply having people listen to to the scrambled speech until they started to understand it.

Back when cordless phones were invented, the base-to-handset frequency was 1700 Khz. That's right, kilohertz. Of course, most AM radios will tune a little higher than the end of the band. You didn't need a scanner back then to listen in, all you needed was an AM radio with the dial turned all the way to the top. The really expensive early cordless phones has frequency inversion ONLY on the AM part of the band (the other frequency was 49Mhz). But most of them didn't, all you needed to listen in was a radio.

M.>MHZ CORDLESS PHONES???.......ANY HELP WOULD BE APPRECIATED.

The Ca DOJ uses frequency inversion on occasion. I just installed
a DS8000 and the darn DOJ has been in the clear ever since. It
costs a little under $100 from real dealers. The mod is very simple
to do if you are the least bit technical.

The DS8000 has 4 inversion freqs which are selected with the Dial
knob. The local button switches the switches it in and out (toggle).

There is one and only one accessory port, thus you couldn't add any
other toys.

Not the reason for the code restriction. The code is necessary for Ham Radio operators to know because of Beacon Identifiers on HF, I believe. Don't quote me on this, but most commercial stations do still use morse beacons as identifiers. As well as for wx reports, etc, and this fact caused the ITU to make a morse requirement for HF the world round, at least where ITU members are concerned. So it's not an FCC decision, but an ITU decision to keep the code requirement. Amatuer status is a way to learn to actually provide a useful skill to people desiring to be professionals as well. What good would amateur radio do if the people training were to leave out some of the HF reqs to get on radio and just talk ? In the Ham world, you're not only supposed to know how to turn on the radio, and use the kewl lingo, but how to repair it if it goes down, how to fix or reconstruct an antenna, and what to do in an emergency situation. If you don't want to learn code, then stay on 30 and up, where you can still do all the things that radio will let you do, without having your signal leave the borders of your own country and encircle the globe. Because believe it or not, there's still some intrinsic dangers with the use of high powered radiators, and there's alot more to this hobby then just making idle chit chat.

BTW, I am a tech plus operator, even though I know the code at 10+ WPM, and not because I am too lazy, but vhf-uhf, packet, sat work, simplex, amprnet tcpip, and alot of other things keep me busy enough to enjoy what I'm doing enough not to want to upgrade just yet. I have a 10 Meter rig, and have 40+ world band contacts on it, some with a mag mount and 25 watts, and yes, some CW. I figure I'll get my general round about the time HF really starts to open up again, and yes, I do believe I'll have no problems passing the code test when it does. 73.

->
->Hi James,
->
-> Most general aviation (private) aircraft operate on the same frequencies as
->the airlines. The reason for this is that they are talking to the same people,
->air traffic controllers. One difference though is that they frequently operate
->out of smaller airports and often the conversations are more relaxed. You
->might try looking for signals in the area of 122 - 123 Mhz. This is where most
->of the unicom frequencies (those used a small airports) are found. If you are
->near to a large airport, you might listen to 121.6 - 122.0 for ground control
->freqs. These are used to direct A/C traffic while taxiing at the airport. If
->you leave me a message telling the vicinity where you live, I will try to give
->you more specific frequencies.
->
-> Hope this helps. Oh, one more thing, 121.5 is the guard or emergency
->frequency. Any traffic you here on this freq. should be regarding a distress
->situation. Also, if you here a warbling tone on this freq., it is an ELT
->(emergency locator transmitter) on some aircraft that has been triggered. Most
->of these are false alarms, but you never know! After an ELT is detected by the
->SARSAT satellite, the USAF tasks the Civil Air Patrol to go find it.
->
->Regards,
->
-><> Glenn Reed <>
-><> OK Wing Communications - C.A.P. <>
-><> Sooner 44 KF5XB <>
->
->
One other aspect you may wish to explore is radio telephone calls from
private aircraft. In my area, (n.e. NJ), I can hear calls via NY Air to
Ground on 454.775 and 454.825. Conversations from people flying in private

jets are often more interesting then ordinary cell or cordless calls. (At least this is what I've been told, as I would'nt listen to such things myself) Also the range is often considerable...hundreds of miles, sometimes very clear, sometimes very scratchy. Plus these frequencys are within the capability of even the most modest of scanners. However, a continuous tone is frequently heard making it difficult to just program these into your radio and wait for some action. You might have to check for them seperatly from time to time.
Phil

> > James

There are a FEW certain frequencies that private aircraft can use to talk to another aircraft. I'm
sure you will find that this is a rare occurence. I don't recall off the top of my head what they are,
but I could look it up if you like.

There are also frequency assignments for private companies. For instance, Collins aviation does LOTS of airwork in my area and have their own frequency as well as a couple of other locally based companies. They are used primarily in this area, and I doubt that they are allowed to use them outside of this area....

My understanding from a local highway patrol officer I know is that it is an identification signal.
There could be other functions that it performs as well, but I'm fairly sure on the ID part.

Him and another trooper were visiting my workplace, and one used the others portable. The one made a comment like "Now they will know I'm with you!"

That's excellent advice about looking it up. Try the library which might
be of help if they have your state, province or city's statute books.
But I would also suggest contact an office such as the legislative office
at your state or provincial capital or your local legislators.

> I have a model 855XLT and the Date of Mfg code is 0E 1C.
>
> Could someone please tell me what is the manif. date and will it lend
> itself to any modifications.
>
> Thanks.

The way Bearcat does their date codes is as follows:

There is a 4 character Non-numeric designator for the date code:

0 - Place holder only
1 - month of manufacture (i.e. 1-Jan, 2-Feb, 3-Mar ,etc.)
2&3 -Year of manufacture.(i.e. IC -93 - I is the 9th letter of the
alphabet, C is the 3rd.)

in Phil's example, OE IC would be 5/93. It should be modifiable. The
mod requires two jumper cuts and the addition of a 10k resistor for both
800 mhz expansion and memory expansion. Check out Radio and tech
Modifications 8A from ARTSCI (818)843-4080. I think Grove carries it
also. Alternatively, check the radio mods on JPL site (on WWW).

Hope that all helps!

Glen,

I have started compiling information for IndyCar Frequencies and related data. You may want to check out the following page:

http://users1.ee.net/rp/indyfrq.htm

If you have anything to add, please drop me a line and also during the Portland weekend, if you gather anything new I would like to have it. I am trying to compile the most timely and accurate info for all scanner users.

Exactly. The so called "secret" channels should remain exactly that,
"secret". If I forgot my password and had to wipe all by lower bank
channels, that would be my problem. I'd rather have that than let
anyone just turn on my scanner with Clear on, and see all :-/ I wonder
if it's possible to get the scanner to do this, say with, a computer
program? I'm not an expert on all this EEPROM programming, but fom what
I gather, this can change the whole working of the scanner.

Wouldn't it be nice if you could add your own BASIC programs to the
scanner :-) If clear%=1 then delete all <no syntax corrections please
;->>

Seeya.

There are several different kinds of tones you could be hearing.
Motorola MDC unit identification, 5/6 tones, GE trunked system
anti-scanning tones, well the point is, different tones are sent
either at the beginning or end of transmissions with different
purposes.

You may not be able to fix them..however, you could try making sure
they are fully depleted, recharging them and doing this several
times.. if it doesn't help, you will have to replace the nicads..
the trick is to always let the nicads run all the way down before
recharging them..

> Oh really, based on what facts?

Surely you're not claiming not to understand the basic tenets of
your own beliefs? Socialism inherently requires that the needs of
those who don't produce be met by those who do. Who carries the
burden in this situation, and conversely, which party is relieved of
the consequences of their (in)actions?

> By the way, you may not indeed have a written contract, but there
> is a social contract between the government and its electorate.

Nonsense. No person who enters into a contract with another can
morally bind a third individual to it involuntarily. There is not
even a contract between elected officials and the specific individuals
who vote for them. If such a contract did exist, most politicians
would spend their time in court defending non-performance suits.

> If you don't wish to be taxed in order to help your fellow man,
> Jack, you have every right to campaign for that.

Taxation doesn't help my fellow man. It fosters resentment and
mistrust in both the taxpayer and recipient, and it establishes a
debilitating dependence that is passed on from one generation to the
next. Taxation also presumes that every person, by virtue of merely
being born, is legally indebted to all others for the remainder of
that person's life. There is not an ounce of morality in any of this.

> But the social costs that you will pay down the road will be far
> greater. Pay me now, or pay even more, as the man once said.

What you're saying is that the end justifies the means. This claim is
the strongest argument in favor of socialism and it has been used by
the worst tyrants in history as justification to murder millions of
their own citizens.

As for the economics of paying now or later, history says you're wrong. Socialism is self-defeating and every nation that has taken this path had ended in economic if not also moral ruin.

> Pray, tell me which mystery is it that I do not wish to discuss? I
> would be most pleased to know what is that I fear not discuss for
> which I have no idea to what you refer.

In the first post, you wrote "An irony that is almost pervers." In your second post, you wrote "Please desist."

The only irony is the self-proclaimed morality of socialists. The perverseness you pointed out is the outcome of their philosophy in action. Socialism requires an abandonment of freedom and near-total withdrawal from logic. Situations like the one under discussion are the inevitable result.

> The point being?....

The fact that a superior intellect such as Thatcher would be offended by the accusation was ample "evidence" to this couple that their views weren't socialist (or that if they were, they were based on "good" socialism). This is the withdrawal from logic that I mentioned above.

>> It takes some pretty tall boots to wade in on that side of the

> .. and even taller boots to wade through the accompanying bovine
> scatology.

Jim, if a thief steals property and donates that property to charity, he has violated the rights of the property owner. Those rights are no less violated when the government commits the same act, even if the majority of the owner's fellow citizens condone it.

You can only successfully propose socialism if the truth of all this is buried in convoluted logic. Unless you can show that the rights of individual persons are no more legitimate than those of ants and bees, your arguments will fail from any objective perspective.

your
>input. Paul

Here in Canada, listening to cell phones is legal, so the 'forbidden fruit' deal probably doesn't wash. But I bought a modifiable PRO-43 for among other things, to listen to cell calls. You're right, you do often get only portions of a call while the phone is in a nearby cell. And they do get boring fast. Most of the calls are almost painful to listen to, they are so mundane. On the other hand, you get the occaisonal gem - exciting or extremely interesting.

As for the ECPA in the US, does the language prohibit 'receiving' the signal? If it does, has anyone ever suggested that everything within range of the transmitter 'receives' the call - my car, the candy bar I'm eating, that house over there, my left eye.... It seems to me that the real 'offence,' if it is or should be one, would be converting that received signal into human understandable form.

>How can I fix them? I dont know much about electronics so it would have
>to simple.

>Many thanks

>Matthew

Go back in time and charge them properly. To do so make sure that the batteries are allmost dead before charging. (you can hook up a 12 volt light to the pack to kill the extra power once you recieve a low battery warning) Then fully charge the batteries. (doing this to your current pack might help)

Also I do not know what voltage your pack is but to speed things up you could use a big resistor to discharge the pack!

Peace.

There are actually two legal impediments to monitoring cell calls here
in the US.
The ECPA , makes it illegal to actualy listen to such calls (also cordless
phone calls).
The TDDRA made it illegal to import into the US, or to manufacture in the
US, any scanners that could operate on (tune to) the cell frequencies after
April, 1994.
The TDDRA rules have some strange parts; any modifications to enable tuning
to the cell frequencies must be "not easily" done, with a short list of things
that are specifically forbidden. Also, the Customs department seems to be
interpreting this to mean, imported for merchandising purposes, as individual
scanners, whether coming in by frieght or luggage, do not appear to be targeted
for any action.

2175. NF2G Scannist Pages update

Newsgroup: rec.radio.scanner
Date: 1996-04-27 00:00:00 UTC
From: D Stark <dstark@frontiernet.net>
Message-ID: <3182A4F6.6F2@frontiernet.net>
Source record: 235123

The May updates to the NF2G Scannist Pages have started already. There are a couple of news items and so forth, but the main change is in format and accessibility.

The <FRAME>-related tags have been removed. Having a large site that supports frames results in a lot of wasted drive space, and the frame takes up screen space that could be put to better use displaying the information that people came to see.

Also, I am in the process of providing text links around the site so that anyone without graphics capability can get past the top level. The clickable image maps are still there, but there is now a text list of all of those links below the map area. Due to the sheer size of my website, this enhancement is going to take some time. At this point, the statewide page and the first three (alphabetically) counties have been "fixed."

The URL is:

http://www.frontiernet.net/~dstark/

If you've visited before, you will also notice that the advertising for my web development business has been removed. The business still exists, but I decided that I really want my personal page to reflect my main hobby and not what I do for a living. Perhaps the change will also make some visitors more comfortable as well.

I'm wanting to know alittle more abt. the aor8000 (with the Dayton Hamfest coming up soon...I just might find a good deal).

1. can you leave the AOR plugged in all the time? I have a bc2500 that has to be un-plugged after abt. 14-16hrs. of charging....

2. I've seen ads showing aor has been blocked-800mz, but quailfied ops can have it opened....who's allowed this mod? Its no real big deal with me but since my 2500 has full 800mz...I'd probably miss it. By chance is it blocked in the software?

3. I haven't dug into the reciever's specs. yet...but is it "triple conversion"?

4. Anyone regret spending the $$ on a aor8000?

Flint,

Comet has a phone # for information and/or a catalog (800)962-2611 and
Amateur Electronic Supply (AES) among others sell both Comet and Madol
products and will happy to send you a catalog. You can contact AES at
(800)558-0411. Pick up a QST magazine to find the names of many other
outlets which will send you a catalog for browsing.

Take care,

Dave

>needed sweep generators to adjust my pro-34. Let me know
>what you find out

Hi guys, I used to have a pro-34 before my pro-43. Now this might sound really strange, I have no idea
why this even works, and I found this fix only by accident when my pro-34 was doing the same thing.

What I did was take out the battery pack, and hook a volt meter up to the terminals. Turn the scanner
on and you'll get a reading. Then push the light button on the scanner and watch the readings go down.
I would hold the light button on until the readings would go down no further.

Turn the scanner off, and then repeat the process. My pro-34 did this to me several times and each time
this brought it back to life.

If anyone has a clue as to why this worked, I'd like to hear it.

Also, I found that it's best never to turn the radio on with an a/c adapter plugged into the charge port.

Hope this helps
take care

Sounds like you're describing identifier tones. Back at dispatch, the console tells the dispatcher which unit just called in. The tones tell which unit it was. Some high-end systems will also advise the dispatcher of the unit's location. That is, when it works. I think our system is about six years old and in all that time, probably hasn't worked more than six days!

Bendix King LPU 4991 series 210 channel UHF hand held commercial grade
radio, downbanded to include the 440 ham band, complete thru 512 Mhz..

Brand new condition, in boxes...

With..

LAA 0325 desk top frop in charger
LAB 0436 hard leather swivel carry case
Two (2) model LAA 0125 10 volt hi-cap nicads batteries
One (1) model LAA 105 10 volt ni cad battery
LAA 0440 LCD protector kit and keyboard cover
Two (2) LAA 0400 metal belt clips
LAA 0701 field radio programming plug
Full LCD and keyboard cover
Programming manual

Price for entire package $800,.00 or best offer, shipped to 48 states.
COD $5.00 extra.

I have a model 855XLT and the Date of Mfg code is 0E 1C.

Could someone please tell me what is the manif. date and will it lend
itself to any modifications.

Thanks.

I have noticed you can tell what language is being used even if it is
inverted simply by the cadence of the speech. Rapid fire Chinese through
a frequency inverter sounds like , you guessed it, rapid fire Chinese!

From the long lost data bank.......
airfone.txt
Listening In to Air-Ground Phone Communications
****

Some people in our hobby find that listening to 800 mhz cellular communications is interesting. Those who do, might find that some real inside, juicy stuff could be found being broadcast from the private jets carrying entertainment industry executives, business leaders, and goverment officials across this great land of ours.

The frequency assignments are as follows:
Channel Ground Plane
1 454.950 459.950
2 454.900 459.900
3 454.850 459.850
4 454.800 459.800
5 454.750 459.750
6 454.700 459.700
7 454.725 459.725
8 454.775 459.775
9 454.825 459.825
10 454.875 459.875
11 454.925 459.925
12 454.975 459.975
CALL 454.675 459.675

The Ground stations broadcast an annoying tone when not in use. The Planes broadcast in simplex only, while the Ground station broadcast duplex similar to cordless phone base/handset operation. The easiest way to monitor this service is to load first a Plane frequency then a Ground frequency for each channel. After loading all the channels go back and lock out all of the Ground frequencies. Scan the Plane frequencies for simplex transmissions and when you get a hit, press your manual key to jump to the next frequency... the locked out ground frequency broadcasting in duplex!

Please keep in mind that the services provided on these frequencies are Common Carrier and perhaps subject to the same laws covering the monitoring of Cellular Phones. In which case it is a violation of federal law to listen to these frequencies.

and........
ag800.txt
Al Quaglieri
Subj: Air-ground phone freqs

The FCC has issued rules on allocation of the 849-851/894-895 MHz bands for air-ground radiotelephone service.

The new action, effective September 9, 1991:

1) changes channel spacing from GTE Airfone Inc.'s de
facto standards;

2) orders GTE to make its service available to other
air-ground licensees at non-discriminatory rates;

3) divides each channel block into 6 control channels
(P-1 through P-6) and 29 communications channels
(C-1 through C-29);

4) provides for a communications channel bandwidth of 6
kHz;

5) gives GTE 22 months to modify its current control
channel scheme; during this period, GTE can use
the lower 20 kHz of each channel block, which
includes channels C-1, C-2, and C-3, for control.
GTE then has another 38 months during which it can
only use a 3.2 kHz control channel in channel C-2
of each channel block. After these transition
periods end (September of 1996), GTE must switch
to control channels marked P-1 through P-6 in the
tables below;

6) empowers the FCC to assign exclusively one control
channel to each air-ground licensee;

7) limits the ERP of airborne stations to 30 watts;
maximum, and that of ground stations to 100 watts
maximum;

8) limits the ERP of ground stations to 1 watt when
communicating with aircraft on the ground.
.pa
GROUND TO AIR CHANNELS

(NOTE" "GB" in these listings denotes Guard Band, a series
of 3 kHz spacings to separate communications channels from
control channels)

Is ther any equipment or software made to track a cellular conversation as it travels from cell-to-cell? This would be for education only.

2207. Re: Best PC Software for AR8000

Newsgroup: rec.radio.scanner

It has an AR8000 utility for reading and writing to the eprom. Also the tactical display is vary handy when working with a trunking system. For example if your trunking system has a data channel that changes every 12 or 24 hors it will lock it out and unlock the last frequency all by it's self. This feature will also work for and channel that is locked on reather it be a dead carrier or a channel that is used for jaming. The system in Portlaned Oregon system uses U.S. Weather to lock your scanner on a givin channel, it changes to a new channel every ten minutes. The program however will lock out the new channel and unlock the last one with no input from you. Very handy.

Bob

11 454.925 459.925
1 454.950 459.950
12 454.975 459.975

Transmissions are FM. Ground stations repeat the airborne
half of the conversation, and transmit a continuous tone when
idle. From one to four channels are assigned in a particular
area.
Service is used on private aircraft.

800 MHz Air to Ground Telephone [22.1107]

- - Airborne - -
Blk Ch 1 - Ch 29

10 894.0055 - 894.1735
9 894.2055 - 894.3735
8 894.4055 - 894.5735 Guard Band -
7 894.6055 - 894.7735 .x765-.x797
6 894.8055 - 894.9735
5 895.0055 - 895.1735 Control Channels -
4 895.2055 - 895.3735 .x813-.x973
3 895.4055 - 895.5735
2 895.6055 - 895.7735
1 895.8055 - 895.9735

Transmissions are AM. Channels are spaced 6 kHz apart. A
specific block of 29 channels is assigned to each geographical
area. Ground frequencies are 45 MHz lower and do not echo the

airborne half of the conversation.
Service is used on passenger airlines.

2209. Radio Shack Pro-41

Newsgroup: rec.radio.scanner
Date: 1996-04-27 00:00:00 UTC
From: ZenCreek@csra.net
Message-ID: <41b7cc$d1726.17e@news.csra.net>
Source record: 235190

I have a probem with the antenna on my por-41. I found that the connector from the center post was broken. The threads were stripped and allowed it to turn when I put my antenna on or off. I tried to replace it but before I could my little boy really messed it up. He broke wires off and I don't know where they were connected. I need a schamitic digram to fix it. Does anyone have a schematic diagram for the pro-41. Please email it to me or tell me how to get one. I would really appreciate any help.

Thank You,
Chris

How about that little country called Canada?

remember us?! Looking under Canada, Ontario, or Toronto nothing came
up. What type of Data base is a "World Frequency Database"? What
countries and types of frequencies are you supposed to have?
Can you tell us more?

>How can I fix them? I dont know much about electronics so it would have
>to simple.

>Many thanks

>Matthew

There are 2 possible fixes. You can try leaving the scanner ON for
seveal days then a FULL recharge. Do this several times. It may work.
Another method is a little more risky. You can buy/build a charger
with a relatively high output. 5 AMPS or so the try recharging BUT
ONLY FOR 5 SECONDS OR SO!!! That can sometimes kick new life into
NiCd's. That also can work for your car battery too. But with that get
a very powerful booster type charger, 200 AMPS. Start charging and
watch the cells. As soon as they all start bubbling, stop charging. BE
CAREFUL!! LEAD-ACID BATTERIES CAN EXPLODE IF OVER-HEATED!!!

: to the cell frequencies must be "not easily" done, with a short list of things
: that are specifically forbidden.

Can anyone explain what is on the "short list"?

Also, is "image" reception of cellular covered at all by the TDDRA? It is my opinion that many scanners can receive cellular well enough on image frequencies that no one really needs to "mod" them. If you're looking for some fun, go into your local radio shack and set up the PRO2035/2042 to scan between 1100 and 1115. It'll pick up cell calls nonstop, you can probably sit outside and watch the bored salesclerk having fun listening to them. On a cellular-"incapable" receiver.

: I am currently buidling a SCA FM decoder from RAMSEY, and I would like
: to know if there is a listing someplace for Connecticut where I will
: find all the neat SCA stuff (Like Muzak and stuff)

The best way is just to tune across the dial and see what you can find. It's very likely you will find Muzak on an SCA in almost every population center.

There is a book called the FM ATLAS which has some data, but it's mostly compiled by one person from comments sent in from readers, it is not 100% accurate. Most of the time, Muzak uses two SCA's on one station, the 67Khz subcarrier has the background "elevator" music, the 92Khz one has foreground "pop" music.

You also might find a second background music service similar to Muzak, a reading service for the visually impaired, foriegn-language stuff, and four or five "buzzsaws" transimtting data as you tune across the SCA band.

Hi!!!!!! This may not be the best newsgroup, but I just have to spread the word. You will thank me if you read this and check it out!

I just bought the BEST VIDEOTAPE IN THE WORLD!!! You just HAVE to check out this videotape these girls made!!!!! IT IS SOOOOOO HOT!!!!!! I own a couple hundred amateur tapes and this is by far the best one I've ever seen!!!!! It's amateur! The quality is pretty good. The girls look HOTTTTTTTTTTTTTTTTTTTTTTTTTTTT!

First of all, these girls are lesbians, and the tapes are mostly all lesbian (there is a HOT blowjob scene in the second tape if you are into male/female...). Tons of anal, sucking, fucking, tongue using, and more! Second, these tapes are completely amateur!!! No actors or anything! These college girls made this tape themselves at first for some extra fun, and then to get some extra money to party!!!

You have to check out their WWW site! It's at:
http://ucsub.colorado.edu/~zens/tricoeds.html or
http://ucsub.colorado.edu/~flickb/tricoeds.html

The web site has some pictures from the video, some video clips, and some information about it. Let me tell you some more about it.

They have extreme closeups of just about everytg this dildo on another girl in the shower, it made me cum almost instantly!!!!!!!!!!!!!!!!!!!!!!!!!!!

And the blowjob scene, where you hear her slurping on this guys dick! Amazing!!

These videos are so cheap, and better than ANY OTHER ADULT TAPE ANYWAY!! YOU HAVE TO OWN THIS TAPE OR AT LEAST LOOK AT THE WEB SITE!!!!

Even if you don't want to buy it, the web site has tons of free shit!

Take it from me! You will NOT be sorry! I *love* these girls! I wish I could fuck them every day!!!!!

Go look at the site NOW or send them some e-mail at tricoeds@ix.netcom.com

Bob the big One...

I don't know about that Barry, but this little jewel of a program
works fine decoding pages. You need to built a little electronic
circuit but it's easy and you can get all the parts at Radio Scrap for
under $10.

That's wrong, wrong, wrong.
There is no law saying that a person, because (s)he is a ham, is authorized
to carry a scanner in a car, regardless of local laws.
There *is* a ruling that hams can carry *ham gear* (does *not* include scanners)
that is capable of scanning public safety frequencies while in a car, but that
specifically does *not* cover scanners.
Both the FCC and the ARRL have been very vocal on explaining this.

I received a BCT 10 last week as a gift. Comments so far.....

1. Audio is horrible with built-in speaker

2. Reception is poor, even with a true mobile antenna (both my Pro 62 & a friends BCT 7 are TONS better).

3. With no frequency read out it is impossible to tell what frequency you are locking out. Along with the poor reception I end up locking out most of the local freqs.

4. I really miss not beiing able to program any frequencies.

I would go with a BCT 7. or a good hand held. The BCT 7 scans Citizens Band, allows 100 user programed freqs, has aircraft band, and still has the Patrol alert.

I have not spent much time trying trunked freqs.
However, I have heard that two scanners, one scanning upwards the other down, helps alot. I don't have the budget for this at the moment.
Supposedly scanners like the original pro2035 re-sort your list so it wouldn't work for the downward searching one.
Bill Cheek, in his Ultimate scanner book, has a great mod in it for scanners like the 2004... and 2035... with the Sound Squelch circuit. I think he calls it a Data Squelch.
You program ALL of the particular trunked freqs. in. And with Data Squelch enabled, it will automatically skip over the "control" frequency in use at the time. This way you don't have to perform this ritual every day manually.
Cheers

Just thought I'd throw this in...

I've ferretted out some 800mhz "public service" freqs in the Boston/Lowell, MA area. I found it interesting to note that many police depts have moved up to this band. The freqs that they use fall in the cellular base/mobile region of the spectrum. In fact, some of my police freqs will pick up cell calls depending on what city I'm in!

Yet, I've found no fire/gov folks using these freqs. Seeing that scanners (at least manufactured in US) are no longer being manufactured cellular capable, I can't help but wonder if the police in the MA area have found a legal loophole to defeat scanners??

What do you folks think? Paranoia on my part?

>post some Australian frequencies. Perferably Western Australia.
For starters, set your limit search between 467.500 mhz and 469.000 and search for Police transmissions. Dont know much about WA but this band is a National allocation. If your scanner has step setting option, chose 25khz.
And get hold of Radio and Communications magazine or back copies CB Action.....they have regular scanning articles.

It certainly is strange. Over here, basically, it's anything other than licensed radio amateurs, WFM broadcasts. I've wanted to know this for a long time ... in America, is it legal to walk around with a scanner, with police frequencies in? The only thing I've seen that is illegal over your side is having one in the car, and having cell frequencies and cordless phones in. I suppose it much depends on the state laws? That would be wonderful, being able to walk around in public with the Police shouting out of the old scanner, with no-one to shut it up :-)

Unfortunately, I've got to stick with the old desktop. I'm planning to get a computer interface in a few weeks, so I can delete all banks manually, and then just put in the bare essentials via the interface, having a different file containing different area's freqs. I am sure there must be a way of deleting all the p/w protected freqs ... and it's really annoying me. I have to find out :-/

Seeya.

Sure thing. I would start raning and raving about how good it is now, but I'll wait a few paragraphs for that :-)

> 1. can you leave the AOR plugged in all the time? I have a bc2500 that
> has to be un-plugged after abt. 14-16hrs. of charging....

IIRC the manual states that it can take 16 hours of charging from flat and then should be turned off for safety. I'm by no means an expert on whether it would blow up, because I've never been silly enough to try ruining my *wonderful* AR8000 :-) I certainly wouldn't think it was wise to leave it on all the time charging. Anyway, why would you want to? I mean, the *wonderful* AR8000 is portable, and shouldn't be used just as a plug in ;-) Take the thing mobile...

> it blocked in the software?

Living in the UK, my scanner isn't blocked. I certainly know that the American version can be unlocked, as there is a page or two about it on the Web, detailing exactly what you do. I'm sure if you ask nicely some fellow scannerist will tell you. Sorry I can't say much about that ...

> 3. I haven't dug into the reciever's specs. yet...but is it "triple
> conversion"?

It certainly is, IIRC. Yet another wonderful feature of the AR8000 scanner. Along with everything else built in, you'd be a fool not to get one (hopefully at a cheap price, as you rightly say). Not knowing how much they go for in America, I can't give an idea of a good price.

> 4. Anyone regret spending the $$ on a aor8000?

Eh? Nononononono. The AR8000 IMO is the best handheld scanner on the market. If you can, you might want to pick up a computer interface as well, as I've heard they make life SOOOOO much easier. I'm going to get one in a few weeks, because if what I've heard on Usenet. Oh, one other thing before I go, you might try and find a good telescopic aerial for the scanner, because (not on mine, mind you) some people say it performs like a rubber carrot :-/

Whatever, have a good time, and make sure you check it's a good quality one. Seeya for now!

The way I do it is....

program the freq's starting with the highest first. Stay in the 868 - 840 range.

you may miss a few words, but not many with a good scanner. The recent
police call book also explains how to follow trunked systems :)

Short summary: Had one. Got an AOR. Much happier.

The RZ-1 is another "scanner" that's based on a modified TV tuner followed by various detectors. As such it has a very wide front end, with all the associated problems.

It's not what I would consider a scanner. It's quite comparable to the (old) Yaesy FRG 9600 - another tv tuner design.

The RZ-1 isn't very fast, isn't very sensitive, and doesn't handle strong adjacent signals very well.

cheers-

I wondered if anyone else has noticed that computer magazines and catalogs sell BNC connectors and accessories. I have a catalog that has things like BNC switchboxes (connect two antennas or scanners to the box, then either one antenna or one scanner to the other side, and switch between them. Useful if you have an outside antenna and two scanners.), BNC wall jacks to make your antenna cable look professionally installed, and even high-quality, very low loss cable. THis stuff is used for computer networking, so it is of the upmost quality, and in most cases only costs a little more than the stuff Radio Shack and other places sell. This might be something you want to look into! IF anyone has any questions, let me know, and I'll answer them. By the way, the catalogs I saw them in are like Lyben Computer Supply, PC Zone, and other catalogs.

Beg to differ. Has been my experience, that scanner usage really depends on the a/c captain's pefceprtion. Some pilots allow it, others don't....even on the same airline. If in doubt, don't use it.

The frequency range will be the same. Double/Triple conversion refers to the clarity of the signal you hear, as your scanner amplifies and then singles out the signal either 2 or 3 times. The cellular band, though, is the 869-916 mhz range. Hope this helps!

> shouting out of the old scanner, with no-one to shut it up :-)
> =====
It's also interesting, some of the things that are taken as facts about a
differnt culture.
For example, it's not illegal to have a scanner with cell phone frequencies
in it. What's illegal is *listening* to them.
Also, the idea that it's illegal to have a scanner in a car is false; there
are, however, many *localities* that make it illegal. And, really strange,
many of those localities exempt amateur radio operators from this restriction.
And, yes, in most places, it's perfectly legal to walk around, in public, with
the police frequencies active on your scanner.

Im mu own, personal opinion, I think that police departments that want to
operate in secret are secret police.

Hi, Yucel...
There are several answers to your question, depending on your wants and needs.
If you want to listen to hams on HF (under 30 MHz), and shortwave (the only way you
will hear radio from your Turkey), then a ShortWave receiver is what you need.
A really good place to go for more advice on that would be rec.radio.shortwave.
That newsgroup is specifically devoted to shortwave, and more people there
would be able to answer your question.
Of course, you will probably getr some good nswers from here, too.
I use a Radio Shack DX 390 for a portable SW radio, and I find it to work very
well.
A transceiver is a radio that both transmits *and* receives, so that's probably
not what you are looking for, unless you want to become an amateur radio operator
(or already are, of course).
Good luck.

I need more information. Do you mean that the police actually transmit on
frequencies reserved for cellular use? or are you saying that they use the 800-900
MHz band?
WHy not tell us what the actual frequencies involved by the police are, and then
we can give a better answer.

=====
Hi, Rich...
On a triple conversion scanner, to receive the base frequencies, you have
to tune to 869-896 MHz.
Triple conversion scanners, as a rule, do not have the images that double
conversion units do, so you can't get the calls without tuning to the correct
frequencies.
(For all you nit-pickers out there, please note that I said, "as a rule", and
do not flood the group with the exceptions.)

Warren,

That should be no problem as scanning for personal listening
(ie, no monetary gain, disclosure of what you hear etc.)
inlcuding the infamous 869-890 MHz range is still quite
legal in Ontario. Just don't bring a radar detector with you
- the authorities frown big time on those items! <G>
Anything in particular you're interested in just drop me
e-mail at the address listed below. I write a monthly
scanning column for DX Ontario, the Toronto-based
SW/Scanning magazine on the Ontario DX Association. I'm
located about 25 miles west of Toronto.

Scanners are perfectly legal in Canada, with one odd exception...
Manitoba has banned mobile use under their Provincial Highway
Traffic Act. But as all telecommunications in Canada is a Federal
concern, Manitoba regulation could be seen as unconstitutional, as
a Federal regulation can not be removed by a local or provicial
act. Toronto is in Ontario so you shouldn't have any problems...

It's funny, but those of us on different sides of the pond have different things we need to put in those "hidden" banks. Over here, it's the cellular and cordless telephone frequencies. Where you are, it's the police frequencies.

: Wouldn't it be nice if you could add your own BASIC programs to the
: scanner :-) If clear%=1 then delete all <no syntax corrections please
: ;->>

Maybe in a few years, AOR will come up with something like that. The best thing you can do now, I guess, is get a computer interface. Like a palmtop computer with cable to the AR8000. Put all the forbidden freqs in the palmtop and program it to wipe everything when you press a key or two. Write your own, highly cryptic, program on the computer that no one but you understands, then no one will figure out what you're listening to.

Ken Hamer (khamer@axionet.com) wrote:

: As for the ECPA in the US, does the language prohibit 'receiving' the
: signal? If it does, has anyone ever suggested that everything within
: range of the transmitter 'receives' the call - my car, the candy bar
: I'm eating, that house over there, my left eye.... It seems to me that
: the real 'offence,' if it is or should be one, would be converting that
: received signal into human understandable form.

I'm sure any court would not find one in violation of the law unless they made a deliberate attempt to listen to private conversations. Also, as a practical matter it needs to be shown they used the information in a way that caused harm to someone. Plain common sense applies here. I mean, military satellites broadcast top-secret information and much of it is beamed where everyone everyone "receives" the signal, although most do not convert the information into human-understandable form. Does that mean everyone in the country is guilty of espionage?

2269. Is Kenwood RZ1 scanner anygood?

Newsgroup: rec.radio.scanner

From: sba3020@InfoNET.st-johns.nf.ca
Message-ID: <4luvnm$70q@coranto.ucs.mun.ca>
Source record: 235142

What's the Kenwood RZ-1 Scanner like to use?

Covers 500 kHz to 905 MHz.

Many of these around?

What's the below 30 MHz reception like?

Many birdies?

If you have one what's the pro's and con's of the receiver?

How fast does it scan?

I read about a problem of the receiver getting hot.

What other receivers would you compare it to.

This radio receives video and stereo so can you find video
or audio channels on your local cable not available with to your
TV/VCR?

No problem...
47 CFR Part 15.121 says (in part):
"... by clipping the leads of, or installing, a simple component such as
a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or
programming a semiconductor chip using an external device, such as a personal
computer. ..."

> having fun listening to them. On a cellular-"incapable" receiver.
> =====
No, the TDDRA specifically states: (same reference)
"... scanning receivers ... must be incapable of operating (tuning)
... within the bands allocated to the ..." cellular phone services.
This means that the scanner can't actually tune to the cell frequencies.
The ECPA covers actually *listening* to the calls, no matter where you are
tuned to.

Another fine point: since it's illegal for the police to listen to cell calls
without a warrant, theoretically, if you have your scanner tuned to the cell
freqs, and the calls are being heard, the police can't enter that room
without either a warrant or probable cause to believe that another crime is
being committed, as the crime of listening to the cell calls isn't within
their jurisdiction.
I actually doubt that this would stop them, but it *is* the way the law reads.

: > region of the spectrum. In fact, some of my police freqs will pick up cell
: > calls depending on what city I'm in!

Most of the time the trunked frequencies are NOT in the cellular band,
they are just below it. Cellular is from 825-849, 869-894. Trunked
radios are a little BELOW both these ranges.

: I need more information. Do you mean that the police actually transmit on
: frequencies reserved for cellular use? or are you saying that they use the 800-900
: MHz band?
: WHy not tell us what the actual frequencies involved by the police are, and then
: we can give a better answer.

It's conceivable, but unlikely, the the cops could be doing some of their
communications with ordinary cell phones. That's the only way they'd be
doing it if they were on the cell frequencies.

Certainly so in the states that don't have restrictions on mobile use of
scanners.

: The only thing I've seen that is illegal
: over your side is having one in the car, and having cell frequencies and
: cordless phones in.

I don't think it's illegal to have the frequencies programmed in, you
have to be caught listening to them to be afoul of the law. Also,
companies openly advertise that they will modify scanners to receive
the cellular frequencies, so this in itself must not be against the law.

It's called image reception, it's where a scanner picks up a signal at a
setting other than the signal's true frequency. It's very common for
blocked scanners to receive cellular this way.

> Thanks in advance.

Hi West. Monitoring Times recently had a review of the PRO-2042. I
remember that it was not entirely complimentary, especially when
compared with the Bearcat top of the line (of course, the Bearcat cannot
be computer controlled). I have modified two PRO-2006's with the OS 456
interface, and with only a few exceptions, the instructions were very
clear. You will have to do some metal nibbling on the PRO-2042, though.
I do find that the scan rate of the OS456's is good (50 channels/min)
with most of my software programs. I'm sure the same is for the
PRO-2042/OS535 interface.
Several of the programs allow you to enter the unlock code. Scancat
Gold does it automatically, Scan*Star/Win has you enter it, and
Scannerwear from RCSI asks for a password, obtainable from them.
Monitoring Times, in the "Ask Bob" article, has the unlock code:

275 681 149 364 630 538 49

Enjoy! I have used the OPTO interface as my primary scanner.

Jim

rhyolite@ripco.com (Joe Macaluso) writes:

>
>Does anyone know a mod for the pro-23.
>
>--
>rhyolite

Joe,

There is one known mod for the Pro-23. Credit for making this mod public goes to Lee Hines, and it is archived along with mods for many other scanners at KILROY.JPL.NASA.GOV, which can probably be reached via ftp and www.

Unfortunately, the modification is not particularly exciting... AND it wipes out any freqs that you have already saved to memory. But you must give it a try.

Press and hold 2,9,and LOCKOUT while turning on the scanner. You will get the following freqs:

138.150
162.400
173.225
406.875
453.250
511.9125
108.500
118.800
127.175
135.500
157.800
482.3625
806.000
857.200
888.960
911.500
954.9125

Have fun with this. I did not find any activity on these frequencies, but I may try it again from time to time. I'd be interested to hear if there are any transmissions on these freqs in your area. I just got my scanner about a month ago, and was pretty jealous of all these people with all these wild modifications...Now that I found one, I guess I'll still be jealous!

Anyway, check out the KILROY site for the complete posting, and let me know how things turn out.

Source record: 234969

You need to be careful of mods that open up gap freqs on RS scanners (or any other scanners for that matter). The service manual will show what diodes enable and disable access to different bands, but in most cases you need extra circuitry, or different component values to tune in those bands. In the case of different component values required, you usually lose one band (which your scanner is tuned to receive) and gain the other (which your scanner is not tuned to receive). So after the mod you receive neither band (although your scanner appears to scan the new band)!

The 800MHz mods work because the circuitry is there to tune in the entire 800 - 900MHz+ band, and access is just denied. The other gaps in scanners are due to circuitry limitations, not just access being denied.

PKH

Your welcome, Brian. While I tend to agree with you generally, your method of expressing yourself leaves something to be desired. It does not speak well of the organizations that you represent when you condesendingly desparage everyone who is apparently less well informed than you are.

In other words..... Lighten up Brian.....

This ain't brain surgery here.....

No.... I wouldn't think it would be. Military frequencies are not listed
ANYWHERE that I know of. That frequency is in fact a federal frequency.
Perhaps a military one. Listen for tactical calls. Like "brown bear" or
"microspeech" or similar.

: However, I have heard that two scanners, one scanning upwards the other
: down, helps alot. I don't have the budget for this at the moment.

Let's take this one step further - get a scanner for *each* frequency
and have it monitor the frequency, not scan.
Since you wouldn't have to scan, you wouldn't need expensive scanners
with all the bells and whistles. You could even use ones which are
broken and don't "scan".

What is a BC 120 XLT worth. Its a 100 channel scanner that handles the aircraft bands. It has 11 bands total, and goes to 512 Mhz.

It's in "as-new" cosmetic shape.

A friend wants to sell it.

Thanks,

Bob

Bill Funk (skypilot@starlink.com) wrote:

: Another fine point: since it's illegal for the police to listen to cell calls
: without a warrant, theoretically, if you have your scanner tuned to the cell
: freqs, and the calls are being heard, the police can't enter that room
: without either a warrant or probable cause to believe that another crime is
: being committed, as the crime of listening to the cell calls isn't within
: their jurisdiction.
: I actually doubt that this would stop them, but it *is* the way the law reads.

Let's see. The cops come a-knockin' on your door and you're inside
listening to cellular calls. You leave the scanner on, then go to the
door and tell the cops, "sorry, you can't come inside because I'm
monitoring cellular phone calls on my scanner and it would be illegal for
YOU to listen to them."

Likely scenario, huh???

sba3020@InfoNET.st-johns.nf.ca (Carl Hodder) wrote:

>What's the Kenwood RZ-1 Scanner like to use?

Very nice. My only complaint is that during a sunny day, the display is hard to read in the car as it isn't quite bright enough but if it is overcast or at night it is plenty bright.

>Covers 500 kHz to 905 MHz.

Yep, am, fm-n, and fm-w

>Many of these around?

Nope. Kenwood didn'e seel that many before discontinuiing them. Had something to do with the price. They were almost $900 Canadian.

>What's the below 30 MHz reception like?

Quite adequate mobile and better fixed. I listen to HCJB, Duetsch Welle, Radio Netherlands, a few African shortwave while driving around town. A bit of fading as you might imagine but tolerable. One word of advice - if you take it mobile use a preamp on the antenna for HF. It makes a world of difference.

>Many birdies?

I have only found one or two.

>If you have one what's the pro's and con's of the receiver?

Pro: small, efficient, good coverage, easily mounted mobile.
Con: requires seperate psu for base use, display is hard to read in bright daylight mobile, speaker is on top which requres more volume mobile unless you use an external speaker.

>How fast does it scan?

Not as fast as a regular scanner but fast enough to cycle through a 10 channel bank in a couple of seconds under squelch.

>I read about a problem of the receiver getting hot.

A bit warm, especially in-dash mounted - mainly because of the flourescent display they use.

>What other receivers would you compare it to.

Icom make one that is close as does AOR but I don't remember the model numbers just off hand.

>This radio receives video and stereo so can you find video
>or audio channels on your local cable not available with to your
>TV/VCR?

I don't have the US model so I don't have the video out jack but the
stereo out works just fine into and stereo amp - home or auto.

I advertised all over the place before I found mine. I have the e-mail
address of a fellow who has one for sale. I was discussing it with hem
before I found the one I have. I can give you it if you like.

>on the a/c captain's pefceprtion. Some pilots allow it, others don't...
>even on the same airline. If in doubt, don't use it.

Agreed. Here's something I wrote some time ago on the subject:

Until recently I thought the prohibition against scanners on
airliners was overcautious at best, if not just downright ignorant
superstition. However, the other night my MVT7100 demonstrated
its ability to blow away TV channels 56 and especially 60, at
least with my little Sony TV out in my neck of the woods (NE
Massachusetts/SE NH). It's clearly only specific combinations of
scanned frequencies versus specific TV channels, but the results
were spectacular: as my scanner went through its programmed freqs
the TV picture rolled, pitched and blinked and the audio snorted
and hissed between modem-like tones. I'll definitely not feel
abused anymore when I refrain from scanning while airborne! BTW
the scanned freqs were ~33Mhz ~150-160Mhz and ~450-480Mhz - I
didn't narrow it down to which particular scanned freq was on the
display at the time the interference occurred.

Regards,

Michael O'Donnell mod@std.com

Mobile use of scanners is also illegal in Nova Scotia except for a
group of excempt parties.

Actually, you used to require a permit for a scanner for mobile use
under federal law. I don't know if that is still in force.

2319. How Uniden came up with freqs on BC-350A

Newsgroup: rec.radio.scanner
Date: 1996-04-29 00:00:00 UTC
From: afn35036@afn.org
Message-ID: <3184ca5e.7401528@usenet.afn.org>
Source record: 234992

I wonder how Uniden came up with the frequencies to put in the service bands (Police, Fire/EMS, etc.). While driving from Gainesville to Jacksonville, FL, I discovered that one of the freqs in the Fire/EMS service band is an amateur radio UHF repeater. It also includes at least one freq. for McDonalds drive-through. It also includes more police freqs than fire and EMS freqs, i.e., I heard more police traffic than fire/EMS traffic on the Fire/EMS service band. Does anybody know if this is by design or did Uniden come up with frequencies at random?

Steve

DEAD SCANNER FOR SALE:

Uniden Bearcat 145XL

I bought this 16 channel desktop scanner at a hamfest, brought it home, and
it doesn't work. The unit will hold frequencies in memory and when the
squelch is turned down, static is heard. However, the receiver does not
seem to be working... for example, it won't pick up the signal from my ham

radio 2 feet away. :) I do not have the manual, the power adapter, or the

antenna. Uniden will service and get this unit working for $45. If anyone
wants the scanner for an extremely low price, let me know. At this point,
it's not worth it for me to get repaired, I don't need it anymore. I figure
if someone else could use it for parts or for the chasis, or keypad, etc., then
it's better than throwing it out. If you're good with scanners, knowing Bearcat
it's probably something as silly as a cold solder joint... but again, I could care
less to get it working.

Price: $15, I'll cover shipping to anywhere in 48 states.
USPS MO Required.

Curtis, while monitoring sci.electronics.design, I noted several more or less polite requests from an antique radio newsgroup specifically requesting no more amateur radio posts - as forbidden by their charter.

If you would really like to convice the usenet user community you are not lazy, can I recommend you trim your address line to groups likely to be interested in what you have to say?

Take a look at my slimmed down list - perhaps that would be more suited to your purpose.

Sincerely,
Brian

Looking for some tips, I am planning on mounting outdoor antenna with coax split to two locations in new house (I'll do this through studs during construction). I'm looking for tips on antenna (mainly 150 - 160mhz, some ~450mhz, some 800mhz), type of coax, splitter, and connectors. Plus any other tips from others who've done something similar. Thanks.

I really wish that people like Wil Flor, who obviously have no idea how
laws are made or enforced, would keep quiet and quit confusing everyone.

Unless a judge in a court of law decides that the various laws about
police receivers in motor vehicles do not apply in any way to ham operators
(in other words, the way Will Flor and others would like to BELIEVE the laws
are written and interpreted), it is still illegal to have a mobile police
receiver in your car in any state that prohibits it - regardless of ham licenses
or anything else.

The courts and legislatures have been clear in interpreting the so-called
"ham exemption" to apply only to equipment that is originally designed to function
as AMATEUR RADIO TRANSCEIVERS that also HAPPEN TO COVER frequencies outside the
ham bands.

Anyone who tells you any different, unless they can cite chapter and
verse of a court decision supporting their position in so many words, is full
of crap.

Show me the way to America .... :-) I can't believe how lucky you are being able to listen to what you want, when you want, with little or no laws regarding it. And you must get more action over your side of the pond, especially if living somewhere big, like LAX or NY.

Ugh.

As I said, I've only been able to base my thoughts on what I've seen in the ng. I have seen much bickering as to whether a ham license exempts you from the law and whether anybody is going to stop you from listening. Don't forget that I only have people's postings to rely on for information regarding America. What I DO fimd strange, like yourself, is that some areas allow you to scan, whereas others don't. You don't get that over here in Great Britain. Re your last point, that must be absolutely /amazing/. If only things were like that over here ... :-(

> Im mu own, personal opinion, I think that police departments that want
> to operate in secret are secret police.

I suppose that being able to listen to Police openly adds bias to your view though. IMO it's perfectly reasonable for Police to expect stuff overheard (whether my mistake or purposely) to remain quiet. I don't know about your end, but some criminals now arm themselves with scanners, to know when Police are coming to get them. This is why the law is useful. However, it can be a real bummer to people who are listening in innocently, and without criminal intent.

Let's not forget to mention the various standard, and proprietary
trunking protocols. Lord help you if you wanna monitor, or even work
with a GE/Erricson "EDACS" system (we won't even get into the NIBs Pac
stuff) ....
It's not just a matter of having the best, or newest, or most
appropriate system. Don't forget that the companies designing and
selling these systems are in it for the Money. That's the bottom line.
Motorola, and GE/Erricson being the most proprietary. Once they have
you hooked into their system and their protected trunking protocols,
you can only buy your equipment from them, and you are severly
limitted as to who can service your equipment.
This does not create a better system, it creates a monopoly like
environment, where they can charge twice, three times, or even ten
times what the normal market would allow for their radios,
accessories, and service. I am not criticizing the quality of the
equipment, it IS top notch, but they are the biggest price gougers
around.
Just one guys opinion...

As seen in Feb. 96', NUTS n' VOLTS, page 52.
1-800-783-4624 Subscriptions and back issues.

Bring those dead Ni-Cad's back to life with the "Nickle-Cadmium
Battery Zapper Kit".

Works with 1.5, 2.4, 3.6, 6, 9, 12 and 24 Volt batteries.

The article describes Ni-Cad 'memory', brief chemistry text, deep
discharging, overcharging and 'whiskers' (dendrites) that cause the
cell(s) to short and refuse charge.

I will caution you that the writer recommends that you 'zap' each cell
within a multi-cell battery. This may require some battery case
disassembly.

The kit appears to be very easy to assemble, even for a novice. All
parts and PC Board, $18.95 plus $4.25 shipping. #C6278.

SW> Which amendment in the Bill of Rights protects your right to LISTEN to
SW> anything you want to??? Remember, the Bill was written about 150 years

You ARE dense, aren't you?

No mere LAW can restrict a freedom that is guaranteed in the Constitution.
Since 'freedom of the press' IS part of the 1st Amendment, the ECPA doesn't
apply to media monitoring scanner transmissions and acting on them.

Now, if you've finished at least th3 5th grade, you SHOULD be able to
understand THAT!

... Floppy not responding, format HARD DRIVE instead?

: That all depends on the what the first Intermediate Frequency is on your
: triple conversion scanner. You have to tune 2 times the IF either above
: or below (likely above) the desired freq. It might not work. One of the
: benefits of triple conversion is eliminating image reception. For most
: radio users, image reception is not desirable.

Scanners which tune wide bands above 1GHz are your best bet for getting cellular images. Most of 1Ghz and above is unused, except for a small bit of ham radio stuff in the 1200Mhz band. For example, the PRO2035 gets cell images quite clearly a little above 1100. There's nothing in this 1100Mhz band to pick up directly, so the weakened image signals come thru quite clearly, at least for the cell sites nearest you. It's actually amazing how well so many cellular-"blocked" receivers pick up the forbidden signals.

Tucker Electronics in Garland, TX. They have Ramsey kits which sell for
under $50 which do this. They have an 1-800 number and advertise in the
scanner mags. In spite of the fact they are "banned" they are still
quite easy to get.

image
> frequency sometime tomorrow. ekh

The Cellular Security group has figured out "virtual downconverter
technology". They just had an article in one of the scanner magazines
to show mods to a PRO-2042. A very simplified explanation of this
technology is this: most scanners are double or triple conversion
receivers. When a local oscillator beats against a received frequency,
a sum and a difference frequency results. One is passed through the
radio as a desired frequency. The other is an image, and the radio
design is meant to suppress that frequency. The "virtual downconverter"
defeats that suppression, and allows the image to come through. A very
good thought, and due to the scanner restriction here in the US, it does
show that "necessity is the mother of invention!"

As to the image, try scanning 360-385 Mhz in 5 or 10 khz steps (NFM)

Steve, if you find out, please let me know. I tried to find out by
calling Uniden service, and they had NO CLUE! I ordered the service
manual to a similar unit, and the frequencies are not listed.

Hi OWL!

I would recommend a Bearcat BCT-7. I mentioned earlier in this newsgroup, I had an original beartracker that only showed state, and whether you were receiving Highway patrol, local police and DOT. I also had a BC700A which had direct frequency readout, turbo scan, service scans and even a spot for private frequencies that you could input. It also scans all of the service bands, and 800-900 mhz (yes-cellular available as an image). I thought "If only they would combine the two units!". Well, they did! The BCT-7 is a great state to state traveler, with an option to put in your local frequencies while in town. It has HP mobile extender alerts as well as all of the above. It has a data lockout feature to get rid of those paging signals, etc.
I have about 10 scanners, and that is my recommendation, without reservation, for a mobile scanner!

2356. Listening to cell calls...

Newsgroup: rec.radio.scanner
Date: 1996-04-30 00:00:00 UTC
From: alanoue@shrsys.hslc.org
Message-ID: <30APR96.23570274@shrsys.hslc.org>
Source record: 234853

I basically agree with what seems to be the general consenses...That for the most part what you hear is often ordinary and mundane, and that it gets old fairly quick, except for the occassional "wild" one. Some of the arguments you hear get kind of funny, and of course there are the standard cheaters and dopers, which can be interesting.
Two, however, stick in my mind. One was where I heard one family member inform another that their father had been diagnosed with cancer. They both naturally enough, broke down and I immediately turned my radio off before I heard any more. I felt terrible. I felt like a real intruder on what was certainly a sad and tragic moment in the lives of a family I'll of course never know. I did'nt listen to the cell band for quite a long time after that.
Another, was where I heard a man who must produce porno films, interviewing a woman for a part in his latest venture. He went on very matter of factly and in explicit detail about what would be required of her. He also took great steps to explain how a certain act could be made "more sanitary, and less painful". This was pretty wild.
Well, just thought I'd throw my .02 in. I'm sure there are many more crazy stories out there.
Phil

I would check these URL's again. I tried all of them from netscape (clicking directly to avoid any typo's on my part) and only 2 or 3 came up, the rest had "400" errors regarding missing URL, or in one case a DNS lookup failure.

PQ>1. can you leave the AOR plugged in all the time? I have a bc2500 that has
PQ>to be un-plugged after abt. 14-16hrs. of charging....

No. It gets very hot. My suggestion is keep a few sets of nicads. Note that
the nicads will last longer if they are not kept on trickle charge constantly
due to dendrite formation (shorts) that occur when constantly charged.

PQ>2. I've seen ads showing aor has been blocked-800mz, but quailfied ops can
PQ>have it opened....who's allowed this mod? Its no real big deal with me but
PQ>since my 2500 has full 800mz...I'd probably miss it. By chance is it
PQ>blocked in the software?

I haven't done this personally, but I am told ScanStar will do this. This
requires you buy a data port interface which is a very long story. [The
connector AOR uses is complete crap and worse can't be found anywhere
but from dealers at an inflated price. Opto modifies the AR8K with 1/8inch
jacks to get around this problem.]

PQ>3. I haven't dug into the reciever's specs. yet...but is it "triple
PQ>conversion"?

Tripple on all but WFM, where it is quad.

PQ>4. Anyone regret spending the $$ on a aor8000?

Yes. I waste lots of time listening to it and hate to leave the
house without. I I I feel so naked without it......

As quoted from <4lrtsf$2la@madeline.ins.cwru.edu> by dg715@cleveland.Freenet.Edu (David Mark):

+---------------
|
| Sounds like you're describing identifier tones. Back at dispatch,
| the console tells the dispatcher which unit just called in. The
| tones tell which unit it was. Some high-end systems will also
| advise the dispatcher of the unit's location. That is, when it
| works. I think our system is about six years old and in all that
| time, probably hasn't worked more than six days!
| --
| (DAVID MARK) dg715@cleveland.freenet.edu

I don't know where Mr. Mark IS, but if he IS in Cleveland (as his address would suggest) I don't know of any system that even tries to send location in this area. Here in the city of Euclid (on Cleveland's east side) the Police, Fire and Service Dept. radios send an I.D. at the end of each transmission to tell the dispawhich unit it WAS. There is some differance of opinion as to which is better (start or end) and the " POWER that BE " decided on the end.

If my memory is correct Las Vegas was one of the first citys to try to do car location, some number of years ago. I don't know if it works, but the cars still have three ant's on the roof or back deck.

They started to scramble these a couple of years ago as competing teams were scanning the talkback. They are listed in the "usual manuals" (i.e. UK Scanning Guide) but not too interesting.

If you want a frequencies database. I will send you mine. Stores up to 1000 freqs / channels / users / remarks and sorts / displays by channel, user, or freq.

Bingo that is what it was tnx., I had cleared out some frequencys on
my bank 6 leaving it empty and did not know that it would not let you
lockout all the frequencys, again tnx for the info .

2371. POCSAG Question

Newsgroup: rec.radio.scanner
Date: 1996-04-30 00:00:00 UTC
From: calloway@gnn.com
Message-ID: <4m51i8$8jr@news-e2d.gnn.com>
Source record: 234898

I've got a question on POCSAG encoding. I was tuning in some digital pager frequencies, and was wondering if they were using POCSAG. I got this frequency off of the back of my Motorola Advisor pager, in case that answers the question. This is roughly what I heard:
"BEEEEEE uhhhhhhhh brrrrrrrrrrrrrrrrrrrrrt..." and then it repeated.

Is this what POCSAG sounds like? Thanks...

2372. Frequencies not where they should be ----help

Newsgroup: rec.radio.scanner
Date: 1996-04-30 00:00:00 UTC
From: probus@wantree.com.au

Source record: 234899
Cross-posted to: rec.radio.scanner,alt.radio.scanner

My 2000 xlt shows frequencies where they are not supposed to be.

Obviously its out of alignment, is it a big job to get it realigned ?

Or is there some little thing I can do to fix it.

Many thanks probus

probus@wantree.com.au

>Is there anyone out there more confused about this thread than I am????
>Geeeeezzzzzzz!!!!!!!

Here's the deal.

The use of ANY portable electronic device on board an aircraft is
prohibited by federal aviation regulation (FAR) 91.21. This section
allows for five exceptions.

1. Heart pacemakers
2. Portable voice recorders
3. Hearing aids
4. Electric shavers

5. Any device that the operator has determined will not cause
interference to aircraft communications or navigation systems.

The key here is the term aircraft "operator". The operator of an
airliner in the the airline company. The FAA leaves the determination on
these matter to the operators. If airline company policy says "no
scanners" and the pilot let's you do it anyway, he/she is violation of
the FAR.

Check airline policy. Just about every airline offers guidance in on
board magazines, etc. on what portable electronic devices they allow and
prohibit, and what retstictions they may have during different phases of
the flight. If they don't have a policy on scanners/receivers then ask
for clarification from the crew.

91.21 applies to general avaition (private) aircraft as well. In this
case it up to the operator and/or pilot in command as to whether any
device can be used.

And by the way. FAR 91.21 was originally written (back in the late 60's
under another number) because of concerns over passengers using VHF FM
receivers in flight. So it is very relavant to scanners.

Is it true that the PL Tones on Motorola 800 MHz Trunked systems are not regular PL Tones like (e.g. 154.250 pl 186.2) ??

In translation, you would not find a freq with 856.2125 pl 127.3 ????

If this is true, is there someone way to get PL Tone on a BC9000XLT with 800 MHz.

Thanks in advance,

JM

Does anyone know where I can get a 400 MHz downconverter to mount between the antenna and the portable scanner. My grandparents have an older scanner that cannot receive the 800 MHz bands but they like this particular scanner too much to trade up to a new one. Local Radio Shack doesn't carry it and the local CB/scanner shop told me that they were banned. Does anyone know of any mail order places that would have this item. If so let me know how I could get in touch with them.
Thanks,
Don

That all depends on the what the first Intermediate Frequency is on your
triple conversion scanner. You have to tune 2 times the IF either above
or below (likely above) the desired freq. It might not work. One of the
benefits of triple conversion is eliminating image reception. For most
radio users, image reception is not desirable.

I don't know much about the AR1000 but it sounds like you are using individual cells (like "AA"s or something).

"Memory" is usually a misdiagnoses. Almost all modern Ni-cads are designed to prevent it. Memory was a very real problem with early ni-cad battery design. Most people still use the term "memory" to describe other problems with ni-cads.

You probably have a weak or reversed cell. The most common cause of cell reversal is over-discharging. What happens is: as a weak cell in a group of cells goes below it's terminal voltage, the remaining cells can still push current through it. This essentially charges the weak cell in reverse. If you have a cell that has not been badly reversed it may be possible to correct it with a full charge cycle. It probebly will never exhibit full capacity again but it could still be usuable.

A weak cell may be the result of damage from overcharging. Heat is a Ni-cad's worst enemy (well they shouldn't be frozen either). Leaving ni-cads on a charger for long periods of time can overheat them and reduce their capacity.

A good, freshly charged cell should show 1.2 volts under a nominal load. Don't let any cells go below 1 volt.

Yes it is. The "BEEEEEE uhhhhhhh" signifies the begining of a message,
and the "brrr...rrrrt" is the actual digital data.

NO! NO! NO!

If this is a NiCd pack with multiple cells (i.e. total voltage more than 1.2V or so, you will probably ruin it. You can only safely discharge single cells this way. i.e. a single AA, AAA, C, or D cell NiCd. If you discharge a multicell NiCd pack this way, you will probably ruin one cell by reverse charging it. If you are using single cell NiCd batteries, you probably have one bad cell. Figure out which one it is by measuring voltage under load once they run down and replace the bad one. Be sure to fully charge all the cells after you replace one.

You can safely discharge a single NiCd cell, but it is very unlikely you actually have memory effect.

It is a bad idea to leave a NiCd battery on charge all the time. Even with a trickle charger, you can eventually damage the battery.

> You may not be able to do anything for the nicad.
> It may be worn out.

I agree. NiCd's die sometimes, no matter how you treat them.

The BC-101 is an older scanner and it IS a programmable scanner. You
must have the 101 manual for the codes. By the way, the factory no
longer carries parts for them, you can't loose for $2.

Good luck on finding the manual.

If you want cell on the 800xlt, just listen to 894-916 Mhz, or so.
You'll get the image freq of the original.

InfoBabe & The V-Chip

Infobabe was not above using her good looks. Men had always looked at her with hunger in their eyes. That is when she saw their eyes. They were usually looking at her long legs, tiny waist, and top heavy boobs that were busting out of her tight knit tops with bare midriffs. She dressed that way on purpose. Well, she liked it when men looked at her and did nice things for her. She knew if she played her cards right, she could be an anchorwoman in front of the camera someday.

The young and luscious Infobabe needed a story. Just graduated from the Dept. Of Journalism at USC, this was her first job. Of course she was a feminist and a super achiever. She planned to lead the life of a glamorous, globe trotting journalist, find romance, marry the editor, adopt two children from a third world country, and generally be a femme fatale. Good looking and willing to work hard, she wanted to make a lot of money. She had to get a big scoop with her first story. Maybe win the Pulitzer Prize. It could happen!

Maybe she could do a Pulitzer Prize winning story about sex on the internet. What about the Hollywood stars that the President was always inviting to the White House? Some of them are already on the internet. The President, the White House and both Houses of Congress have web sites. And, she had heard about Latoya Jackson's new internet sex service. Maybe this was her big story. After using a search engine, she found the home page for Latoya Jackson's Live Sex Show at http://gramercy.ios.com/~genen9/showall.html

That was the celebrity Latoya Jackson, sister of Michael Jackson. This young Infobabe could use a story about the famous sexy star Latoya. She needed an inside angle, and there was a way. She would get a job with the internet sex service. She knew a famous feminist used the same tactic to penetrate Playboy during the '60s. Our foxy Infobabe set up a job interview, and dressed to impress.

She got a lot of looks and few whistles when she went out on the street. The cab driver got a great look up her micro-miniskirt when she slid onto the back seat. She knew he was looking up her dress in the rear view mirror, but her dress was too short to do anything about it. So, she just giggled a little.

At the job interview the receptionist told her to take off her little jacket and go in to see Mr. Big. It was cool in the air conditioning and her nipples poked out the front of her knit top. Mr. Big looked her up and down, and then walked around her. He told her to sit on the low couch. She did sit, and did not bother to cover anything. After all, she really wanted the story and the job.

Mr. Big introduced her to Mr. Censor who came straight from the White House. Then, Mr. Big informed her that the job would be stripping in front of a TV camera connected to the internet. She would be in a booth with a computer keyboard. People would call into Latoya Jackson's Live Sex Show and tell our luscious little Infobabe what to do. Then she would do it. They would see her do it, live and instantaneously on their computer screens. With so many people watching the pay was great, the work would be fun, and it did not cost the internet viewer very much.

She decided to take the job, but first there was a test. Mr. big wanted to see how she would perform. Would she be pleasing? Was she sexy? Did she look as good naked as she did half naked on the couch with her g-string panties showing and her nipples poking out? Would Mr. Censor object to her performance?

Mr. Censor produced a V-Chip. He told her what it was and gave her the V-Chip. Somehow the V-Chip was going to stop crime, gangs, welfare, unwed mothers, alcoholics, drugs, and keep jobs from going overseas. Most of all the V-Chip would make sure the President got reelected. Well, she liked that big handsome hunk of a President. Better still, she knew the President liked women. I mean he didn't just pretend he liked them. He made love to them every chance he got. She would give him some good copy!

She did not understand all the technical mumbo-jumbo that Mr. Censor spouted, but she wanted to pass the test. She wanted to get the job, help the President, and win the Pulitzer. She did not have any pockets in her skimpy outfit, so she took the V-Chip and stuck it down the front of her little g-string panties. Then, she looked up at Mr. Big. She could see that the lump in the handsome Mr. Big's pants had gotten bigger. Even Mr. Censor's lump had gotten bigger. She wondered if Mr. Censor kept V-Chips down the front of his pants too. She wondered just how far this test would go. How far did she want it to go? Should she dance first? Rub up against Mr. Big? Or, just start with a big move and reach up under her micro-miniskirt and pull her panties down the very first thing? She was losing her professional perspective, and her panties were getting wet just from thinking about it. If she removed her panties first, the V-Chip would fall out. What the heck, she thought, the moisture

can't be doing that V-Chip any good.

"Oh, one more thing," Mr. Big said, "that little red
light means the TV camera will be showing your screen test
to thousands of internet men and women. You don't mind do you?"
She could just barely nod her head that it was ok. Her face
flushed, her chest heaved up and down as she breathed hard.
Her nipples got a little larger and her panties got wetter.
This was so much more exciting than she had expected. It was
more exciting than the time the traveling evangelist helped
her find GOD out behind the barn. Imagine that! Now, she was
committed to getting the story and the job. She was on a mission.
InfoBabe just knew she would be good at it. She could be a great
reporter, a sexy star and help the President control the future!

Her legs trembled a little, as she stretched and ran her
hands involuntarily over her body, from her neck, over her
full breasts lingering over her nipples, and down to the V
between her legs. Infobabe's screen test had begun, and she
wants you to go to the home page of Latoya's Live Sex Show
at http://gramercy.ios.com/~genen9/showall.html
to watch and tell her what to do.

Motorola uses non-standard tones to signal the end of transmission for thier trunked systems.
These tones are not used for CTCSS capabilities like PL, etc. For conventional 800 Mhz, PL and DPL
may be used.

there might be some Motorola Trunked 800 MHz systems that use PL, but
all that I'm familiar with use DPL (digital PL) instead. I'd be interested
in hearing of any DPL boards for scanners - I've never heard of one.

I just got a Pro 60 - my first scanner - and am having fun with it so far. I do have some Newbie questions regarding trunked systems. The Oakland PD here uses a trunked system (EDAC?). From reading Police Call Plus, it says to program in the repeater channels in descending order, which I did. There are 14 of them and they all seem to be used. I'm still having a hard time following the conversations. Anybody have any tips about monitoring trunked systems or are bits and pieces of conversation as good as it gets? Would a Gee Whiz mod help in getting rid of the beep tones? Thanks for any info.

>Most of the time the trunked frequencies are NOT in the cellular band,
>they are just below it. Cellular is from 825-849, 869-894. Trunked
>radios are a little BELOW both these ranges.

The trunked/conventional 800 Mhz channels for part 90 systems (such as a
fire/police department) are different from cellular all the time.

800Mhz PLMR channels for base stations are from 851 Mhz to 869 Mhz. The
mobiles transmit 45 Mhz below the base stations (806-821). None of these
frequencies are in the cellular service.

900 Mhz systems have base station channels from from 935 Mhz to 940 Mhz.
The mobiles transmit 39 Mhz below the base stations (896-901).

If you are hearing what you think are cellular calls on these
frequencies, you are probably hearing images.

> > >hint>. Gosh, did I say that?

I HATE WHEN RUMORS RUN WILD. SO HERE IS THE TRUTH CONCERNING THE LAPD FREQS AND RADIOS.
ALMOST ALL OF THE DEPT HAS BEEN TRANSFORMED TO THE ASTRO RADIOS. THE MAJORITY OF THE FREQS
ARE
IN THE 500MHZ. RANGE. I HAVE NO INTENTION OF CHANGING THAT. THE MDT COMPUTERS ARE IN THE
VHF RANGE.
AGAIN I HAVE NO INTENTION OF CHANGING THAT OUT. WHAT WILL BE HAPPENING IS THAT IT WILL BE
TURNING INTO
A DIGITAL BACKBONE FOR THE AUDIO FREQS. ALSO DIGITALLY SCRAMBLED AS IT STANDS RIGHT NOW.
THE FIRST OF THE
RECIEVER SIGHTS ARE BEING INSTALLED RIGHT NOW. THIS MEANS THAT YOU WILL NOT BE ABLE TO SCAN
OR LISTEN TO
OUR CHANNELS ANYMORE. IT IS REALLY NECESSARY FOR OFFICER SAFETY. TO MANY OF THE BAD GUYS
HAVE SCANNERS.
THE MDT COMPUTER SYSTEM IS NOW UNDER CONTRACT TO BE REPLACED. MOTOROLA HAS GOT THE CONTRACT
AND WILL BE

INSTALLING THE NEW SYSTEM WITHIN TWO YEARS.. AS FAR AS I KNOW WE ARE STAYING THE SAME FREQS. 800 MHZ IS FOR
THE FIRE DEPT. I CAN ONLY SPEAK FOR THE CITY NOT THE COUNTY OF L.A..

Anyone out there want to brag about their BC9000.

I'm interested in getting the scanner but I don't know any stats on it yet. Like the scanning speed and frequency ranges and all of the bells and whistles.

I've had my PRO-43 for a while and have made some mods to it and now it screams. But I'm tired of recharging those damn batteries and knocking it over. The scanner is on the shelf right above my computer and the base of the scanner isn't too sturdy.

Thanks in advance.

: listening in innocently, and without criminal intent.

The vast majority of Police communications in US cities is done by data terminals in the police cars. Routine dispatches are done by having the data pop up on a small CRT sitting on the officer's dashboard. It's very likely that if you're a criminal you'll never hear on the radio the announcement they're coming for you . The radios are used only to supplement the data terminals, and for "special" situations.

The SSTV WWW sites should list it, www.qrz.com should have it, and
then there is always a search via www.shareware.com WWW site.

>Matthew

You have a classic nicad problem--- overcharging, underusing.

Take the nicad and attach a lamp to it. Discharge the battery until the
lamp gets dim. DO NOT let the lamp go all the way out.
Then recharge the nicad. Repeat the sequence several times. If it
is working, the lamp will stay on longer and longer. When the length
of time that the light stays on does not increase, you have done all that
you can for the nicad.

You may not be able to do anything for the nicad.
It may be worn out.

All the best.

This is the IF freq range for this scanner.
There is NO diode to cut or add to get this range (this is UHF TV).
Why would you want to listen to video sync buzz and wide band audio??

I have a Radio Shack 2006 and I have noticed a problem with locking
out channel 240 of bank 6 . If left blank "000.000" or if I put in a
frequency ,say 162.400 it will not let me lock that frequency out .
Its not a big deal but I was wondering if other 2006's do the same ?

That is correct it depends on your state... it also depends on the
wording of the law and the inerpertation of the law. In Florida the
Law states that a scanner must not me "INSTALLED" in a vehicle. The
word INSTALLED is not defined in the statute book so it's up to the
interpertation of the officer and the judge

2426. Indiana and Kentucky Scanner Laws

I'm planning on taking a road trip in the next few weeks. I'll be traveling to Charlotte, and then up to Minnesota. Two possible routes of travel from NC to MN...one goes across Indiana and Kentucky, and the other does not. I know that both these states have extremely restrictive scanner laws (probably unconstitutional, too...but that's another issue), but are their exemptions for licensed amateur radio operators? (I am one) If not, then I will simply go the other route.

Anyone know for sure?

For Sale:

Radio Shack Scanners:

PRO2006: 25-520, 760-1300. Modified for full cellular coverage, plus scan/search speed doubled. Triple-conversion, 400 memories in 10 banks, 10 search banks, 10 monitor channels, tape-out jack, like-new condition. $350 or best offer. FREE: Scanner Modification Handbook. (Has mods for these scanners.)

PRO43: Handheld. 30-54, 118-174, 220-512, 806-1000 (less cellular). Includes military air! I have not modified it for cellular but it can be (some PRO-43's and all later models cannot be modified). 200 channles in 10 banks, 10 monitor channels. $275 or best offer. FREE: Extra metal extendable ant., clip-on extension speaker.

PRO2021: 30-54, 108-136, 144-174, 380-512. 200 channels in 10 banks, 10 monitor channels, mounting bracket, tape-out jack. Metal case, and very sensitive. $100 or best offer.

Grove Scantanna, all band scanner ant. with 50ft of coax. Excellent omnidirectional scanner ant. Has BNC connector (I use it on the PRO2006). $80 or best offer.

For only $725, buy the whole thing, and I'll throw in a voice-activated tape-recorder, with cable and attenuator jack for the PRO2006 or PRO2021.

E-mail me or call at (602) 892-2386.

system to set up and maintain.

2429. King County, WA frequency help requested

Newsgroup: rec.radio.scanner
Date: 1996-04-30 00:00:00 UTC
From: jonma@ix.netcom.com
Message-ID: <4m46ab$9m4@dfw-ixnews5.ix.netcom.com>
Source record: 235079

I've just started to get into scanning, monitoring the local police, fire, emergency, and aircraft frequencies so far. I live in Redmond, WA, a suburb of Seattle.

The handheld scanner I bought from Radio Shack has a search feature, so when I first got the thing, I just searched frequency bands looking for interesting stuff. I've found a dozen or so pretty active freqs in my area that I monitor now.

I bought Radio Shack's _Police Call Plus_ book and found some interesting freqs there and I just found a web site that has a bunch of frequency listings for my area.

I have a couple of questions, hopefully there's someone out there in this area who can answer.

First, the Radio Shack person said that the Redmond police had recently moved up to the 800 band, but I've been unable to find them up there. Can anyone confirm or deny?

Second, there are two very active frequencies I monitor that sound a lot like Redmond or King County police dispatching but I can't find the frequencies listed anywhere. They are 481.925 and 482.050. Does anybody know what these are?

If this is too narrow for this newsgroup, please email me in reply.

Thanks,

Jonathan

2431. PRO-2005 & BC-890XLT (with CTCSS) for sale

Newsgroup: rec.radio.scanner
Date: 1996-04-30 00:00:00 UTC
From: tim@umcc.umcc.umich.edu
Message-ID: <4m491t$r3r@umcc.umcc.umich.edu>
Source record: 235081
Cross-posted to: rec.radio.swap,rec.radio.scanner

FOR SALE

Uniden Bearcat BC-890XLT scanner, with BC002 optional CTCSS board installed.

System was bought new in December, 94 as a Christmas present for
a proverbial little old lady, who subsequently has used it for a total of
approximately 24 hours at the most.

It hasnt been used at all in many months, so shes interested in
selling it.

The BC-890 is a 200-channel scanner, covering 29-54MHz , 108-174,
216-512, and 806-956MHz (minus cellular, which is not restorable as far
as I know).

A fairly unique feature is NWS weather-alert capability.

The BC-890 is an all-around very good scanner (Ive owned one for
several years, and also own PRO-2006s, Icom R-7100, Yaesu FRG-9600,
PRO-43, AOR AR-8000, etc.) decent channel capacity & spectrum coverage,
very fast scan/search, good audio, & other misc. features. The CTCSS
option is very handy to have, and is why I use my own BC-890 more often
than I use some of my other, more expensive scanning receivers. But I
would NOT recommend buying the BC-890 if you live inside an RF-dense
area, with lots of pagers, broadcast stations, etc. because the 890 does
pick up pretty easily!

Unit is in excellent condition, with original box & manual, etc.

$215, includes UPS shipping within CONUS.

****

Radio Shack PRO-2005 base/mobile scanner, 400 memory channels, 25-520MHz
+ 760-1300MHz continuos, NBFM/WBFM/AM modes.

Only mods/alterations are full 800MHz restored, an RCA jack on the back
for CTCSS readout (using an Opto DC440), and Ive sprayed an EMI/RFI
shielding material on the inside of the plastic shell.

This unit is in excellent cosmetic & operational condition EXCEPT FOR one
of the plastic swivel legs (to raise the scanner up from a horizontal
position to a slightly angled position) has cleanly broken off.

Comes with original box & manual.

$260, includes UPS shipping within the CONUS.

****

Please send email if you're interested in either one of these scanners.

Tim

The reason why most airlines don't allow scanners/radios/electronic
devices on planes is because they emit interference that can really screw
around with the electronics on most planes, and particularly the flight
controls on some newer, "fly-by-wire" planes.

The same thing happened to me. The problem in my case was that the 12 volt
jack is made of plastic, and the hole became oval, instead of round, and the
connection was intermittant. The Audio out suffered from the same problem.

Seeing a trend here, I made up 6" pigtails to extend the connections out &
away from the chassis. I went to Rat Shack & got a 1/8" Jack (female) for the
audio, and mounted it on the end of a 6" zip-cord pigtail, which was soldered
to the PCB in place of the factory chassis mount jack. I did the same thing
for the 12 VDC power, but used 2 circuit "Jones Plugs". These are polarized
plugs that CAN'T be plugged in backwards, are durable, etc.

I've standardized ALL of my vehicles, bench, house, emergency batteries with
these Jones Plugs, not just on my scanners, but, on all of my radios. I have
alot of flexability with all of the plugs/jacks being standardized; previous
to that most of my radios had DISSIMILAR plugs/jacks

By extending my connections for both the audio and the power, I have less
stress on my cables & wires, and can better locate the radios in regards to
positioning and space requirements

Good Luck,

I used to enjoy browsing the dozens of postings on this group, and others, pertaining to the myriad of problems with Radio Shack....However, this type of posting seems to have dried up in the last six weeks or so. What gives? Has RS been putting pressure on moderators to tone down the discourse?

I'm a former employee with no particular ax to grind with RS...I simply left after finding more profitable employment elsewhere. I even stayed on for a time as a part-time employee, but you can only spend so many hours a week surrounded by miserable people.

I don't know if the district I worked in is a microcosm of RS nationwide, but the back-stabbing, sales-stealing, and unrealistic expectations by managers were enough to make me run for the hills. Yes, RS sales droids are unknowledgable, commission-driven name-takers..but have a little pity. Most of them are making 4.80 an hour, or 6.5% commission. (Whichever is higher.) A *good* day at RS is $80 an hour in sales....so that means a whopping $5.20 an hour. There are higher pay tiers, of course, but you have to be a key-holder to really be able to reach those higher commissions: he who closes the store at night also has the opportunity to re-distribute the day's sales in a more, ahem, equitable fashion.

It was an excellent learning experience on how to grow eyes in the back of your head.

Federal and Military frequencies are managed by IRAC, not the FCC. There are
books out that will explain the freqs & tactical identfiers...

=====
I just tried this on both of my 2006's, and 240 locks out just fine.
The 2006 does not allow you to lock out *all* of the channels in a bank.
Since 240 is the last channel in Bank 6, the thought occurs that you
might be trying to lock out all the channels in bank 6. If so, you
can't do that.
Otherwise, I can't think of any reason 240 would be unlike all the
other channels.

trunked systems usually use a group of frequencies. the user can come up
on any of the frequencies. frequencies may be 1mhz apart..though not always..
find the data channel and you can easily find the others!

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
taxis, and buses are all equipped with radios and you can
listen to them. You can monitor the local sheriff and fire
departments to hear about events "as they happen," before
the news reporters hear about them. Hostage dramas, bank
robberies, car crashes, chemical spills, neighbor and
domestic disputes, tornado sightings are all fair game. In
a single afternoon, you can hear a high speed police chase,
Drug Enforcement agents on a sting operation, and
undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly

reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer to replace the stock antenna with an Icom FA-1433B dual band flex antenna which is thin and very flexible while providing better performance than a stock antenna.

Although it is small and somewhat tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Since 1988, I've used the "Thin-Stick" 18 inch telescoping antenna for extended range on my portable scanners and 2 meter walkie-talkies. The Thin-Stick, made in USA by Smiley Antenna Co., Inc., is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend

reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two

companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The 1996 editions contain selected business listings, too, although callsigns are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new, 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees,

listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about

$100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall

security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an

outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $27.00 per year, which includes the monthly Scanner Journal, approximately 50 pages in 8-1/2" x 11" format. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. The RCMA web page is at http://comp.uark.edu/~plaws/rcma/. The RCMA electronic mail address is RCMAHQ@GEnie.com.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at: |

- the Destiny Restaurant, on Rand Road, in Des Plaines, |

- Philly's in the shopping center at the corner Rt. 83 | and 53rd St. in Willowbrook, |

- The Great Escape, on Irving Park Road, Schiller Park |

and at other restaurants.

Yeah, I had a good one too the other day. I went to the RS on Navarre Ave. in Toledo, OH. The Manager, a guy named Roland, tracked down a Pro-2035 at another store since it was discontinued and he didn't have any. He arranged for UPS to send it express to his store, where I picked it up the next day. On top of that, when I went to pay for a couple back issues of Radio magazine, he said "Don't worry about it, you're all set!" Sure, the scanner was $400, and the magazines were about $3, but it's the little things like that that make you want to go back.

> "BEEEEEE uhhhhhhhh brrrrrrrrrrrrrrrrrrrrrt..." and then it repeated.
>
> Is this what POCSAG sounds like? Thanks...

Yes. There are simple POCSAG decoders that you can plug into your earphone jack, then into a RS232 (serial) port on your PC. Then you run a DOS program that will display the Alpha/Numeric messages that go out to ALL pagers on the frequency you have tuned in. You can display to screen, send to your printer, or save to an ASCII text file on your hard drive. Some software allows you to set alarms to signal you in the event of reception of particular pagers your interested in if you know there CAP code. Sometimes interesting, usually boring. It is still legal to monitor "digital" pagers...but not "voice" pagers.

[last changed 03-Jan-96]

Changes preceeded by "|". Please e-mail corrections and additions to me.

The latest version of this file can be accessed via anonymous ftp to agora.rdrop.com in /pub/users/billmc/fcc_sources or via my web page at: http://www.rdrop.com/users/billmc

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists. The FCC master contains a wealth of data about every non-government license in the United States (over three million records). Most of the sources listed contain a subset of this data, although a few contain all or nearly all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing FCC data, you might want to consider forming a co-op of people in your area to share the cost. As far as I can tell, this is legal since the information is in the public domain. However, the software supplied to view or manipulate the data is usually copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular version is $104, and the mapping version is $174.

Floppies are available by state for $44 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155 (voice) or http://www.grove.net/ (WWW).

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and comes with a simple database search program. Regional CDs cover
| subsets of the US but come with a more powerful database manager and
| provide more detail about each license. Also available is a Ham callsign
| and repeater database CD.

| Spectrum costs $37, and the Ham and Repeater Database is $21. Regional
| CDs are $137 for the first CD, $102 each additional CD ($560 for the
| entire 6 CD set). Data is updated twice a year. PerCon can be reached
| at 716-386-6015 (voice), 716-386-6013 (fax), support@perconcorp.com
| (email), or http://www.perconcorp.com (WWW). The Spectrum database can
| be searched free of charge via Percon's WWW page.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service provides a custom report of frequencies, callsigns, and licensee names for a specified area in any of the 50 states. Coverage areas of 4 to 256 square miles will be chosen by Bob depending on transmitter site density. The report includes a color plot with transmitter sites marked.

To create the report, Bob requires the latitude and longitude (or nearest street intersection) of the center location. Reports are $26 each. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543, or call him at 708-554-3839 between 6-10 PM central time.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.x. It comes with FCC data for one state, covering all services and all frequencies. Data is updated approximately
| every six months.

Cost is $35 for the first state and $20 for each additional state. Updates cost $30 per state. (Add $5 for CA, FL, TX, NY.) Quantity discounts available. Fully working shareware copy (FCC215.ZIP) downloadable from their BBS at 360-871-4228 (below 9600) or 360-871-4591 (9600-28.8k). ScanWare Associates can be reached at 360-698-1383 (voice), 360-698-8207 (fax), scanware@sincom.com (e-mail), and http://cutter.sincom.com/~scanware/index.html (WWW).

US SCANNER PUBLICATIONS

Similar in style to Police Call, this series of directories covers ALL radio services between 30 MHz and 2 GHz. Each volume covers one state and costs between $14 and $29, depending on the state. The volume for California is 820 pages. Contact US Scanner publications at 800-890-6999 (voice) or 503-233-5176 (fax).

APPENDIX

Here is table of data fields in the FCC master. Fields provided by various products are indicated by "#" or the field length, if known.

I thought it was illegal to "decode" any scrambled transmission, and even though the data on POCSAG transmissions isn't encrypted, it's in digital form, which can't be decoded with a conventional scanner. Therefore, since it's technically an encoded transmission, it's illegal to decode it? I think I read this somewhere, but I may be mistaken.

Does anyone have a copy of the owner's manual for the Bearcat 101 scanner?

Also, does anyone know of a freeware computer program that lets you input a frequency and it tells you which switches to flip?

Thanks for any information you can provide.

Also, a big 'thank you' to all those who responded to my last note entitled 'Scanner NEWBIE Questions'. I did not receive even one sarcasric reply, (even to my really dumb ON/OFF switch question!) and I received a lot of good information.

David H. Malin (aa6rv@earthlink.net) wrote:
: AGAIN I HAVE NO INTENTION OF CHANGING THAT OUT. WHAT WILL BE HAPPENING IS THAT IT WILL BE TURNING INTO
: A DIGITAL BACKBONE FOR THE AUDIO FREQS. ALSO DIGITALLY SCRAMBLED AS IT STANDS RIGHT NOW. THE FIRST OF THE
: RECIEVER SIGHTS ARE BEING INSTALLED RIGHT NOW. THIS MEANS THAT YOU WILL NOT BE ABLE TO SCAN OR LISTEN TO
: OUR CHANNELS ANYMORE. IT IS REALLY NECESSARY FOR OFFICER SAFETY. TO MANY OF THE BAD GUYS HAVE SCANNERS.

Uh - 'Bad Guys' like watchdog groups, civilian review boards, the press,...???
Officer safety IS a very important issue, but that really argues for tactical
scrambling on an incident-by-incident basis. In a city where all too often
the cops are viewed as the bad guys, wholescale scrambling of all communications
can't be a very smart idea. It's overkill - and regardless of the stated
intentions, the public will perceive it's primary function to be one of
cover up.

Consider the plethora of conspiracy theories that have arisen to explain
things covered under the blanket of "National Security". Just as many
folks feel the federal government can't be trusted, many locals feel the
PD can't be trusted - how long after switching to full-time scrambling
do you think it will be before the very wild rumors you hate begin to
circulate? With civilian oversight locked out, who will come to the
defense of the department? Little old ladies from the valley waving
blue ribbons aren't going to carry much credibility in the parts of
the city where credible oversight will be needed most.

Knowlegable, informed people are the department's greatest asset.
Think of it this way - COPS comes to town, what - once a year or
so? For the vast majority of scanner owners, the hobby is like a
nightly version of COPS. The folks who listen routinely are much
more likely to understand the difference between harassment and a
felony stop, code 7 and a doughnut run... in a department with
nothing to hide, this should be considered something positive.

When the public is cut out of the picture, they're going to wonder
what the department is trying to hide, and why they're paying for it.
[or perhaps HOW they'll wind up paying for it]

>

No, actually it's not the input/output frequencies. It is separated by
43, yes 43, not 45 Mhz. My scanner covers the same frequencies as his,
but his is older. If I have a freq on 906.5375, his shows it on
863.5375. If I go to 863.5375, I can not pick it up, and he can't pick it
up on 906.5375. Oh, did I mention that it's separated by 43 Mhz, and not
45!

Too many of the "bad guys" have scanners? Most criminals either aren't smart enough (no derogatory sense intended) or simply don't care about the frequencies. After all, if I am going to murder or rape somebody, I wouldn't wait around the 5 minutes it takes to get the police there. I would be long gone way before the dispatcher alerts the squad car!!!!!

You must be in a good area for strong signals. The impedance mismatch has little effect on receivers. The 50 ohm rg-58 is great for UNDER 30 Mhz, but above 30 mhz there is more signal lose the higher you go in frequency.

rg-59, which is 75 ohm, is the same stuff cable tv companies use because of it's excellent higher frequency capability. This is what I use...

Good Luck,

How many police lives will be endangered, rather than saved, because no one else was listening? I know of several occasions, not necessarily acknowledged, where an officer was assisted by a scanner listener where they were being assaulted or they were injured.

During the LA riots, scanners kept people, one step ahead(so to speak) of the mobs. Without advance warning, how many peoples lives will be lost?

I guess we should sell our scanners, and buy more guns.

Since we won't know if trouble is coming our way, we won't be able to run.

We'll have to stay and fight (or die)!

>I understand this is a common problem.
>What does it cost to fix?

Well, if you are resonably good at such things, it's cheap. Just behind the front panel is a small circuit board with a DC-to-DC convertor circuit. There are two capacitors there, 10 uF if memory serves me right. One is yellow and the other brown. If you replace the brown one with one that is still yellow, it works again. :-)

Better yet, replace them both with orange ones. (Isn't electronics easy?) :-)

BTW, when the sensitivity starts going, do the same with the caps in the main DC-to-DC convertor board. Small one with metal covers.

From: Ken Wyatt <kenw@col.hp.com>
Message-ID: <4m8q8k$pbo@nonews.col.hp.com>
Source record: 234770

I can only speak for the Opto Scout, as I'm unfamiliar with the '8000.

This is one of the most useful scanning accessaries I've ever owned. The sensitivity is adaquate (range up to 500 feet; 100-200 feet, typical), it locks on quickly, and I love all the memory channels. It IS affected by nearby paging signals and will record a range of frequency "hits" on both sides of the carrier frequency (due to the broadbanded digital nature of the transmission). It is also affected by strong local FM stations which effectively reduce the range considerably. Since all "frequency finders" exhibit the same problems, I wouldn't discount the Scout performance at all.

Make SURE you buy one with firmware version 3.0, or higher; as this performs vastly superior to V2.0 and lower. The earlier versions tended to lock up on their internal noise.

For operation with the AOR 8000, you MUST have version 3.1(?), or higher. You might confirm this with Optoelectronics prior to your purchase.

73, Ken

>> No, it's not "image reception." Cellular phones have an input and an
>> output frequency, both being separtated by 45 Mhz. You are hearing the
>> other frequency, whether it be the output or input.
>

Yes it is Imaging! It depends on what Frequency the internal crystal is. Alot of scanners (dual and some tripple conversion) will pick up frequecies exactly the Amount of the internal crystal higher than it is. Example : I have heard 144-148 mhz repeaters around the 160 mhz region. The term for this is FREQUENCY MIXING.
So the fist answer was half right and the second was wrong.

Ps. No doubt the guys friend was using a Radio Shack hand held Pro-42 or 52 ....they Usally pick up cell phones around the 855 mhz region unmodified. Flame me if I am wrong.....Like you wouldn't anyway!

As far as the AR8000, you can use a Scout version 3.0 or less. but must
purchase a CBAR adapter from Optoelectronics for about $40-50.
Interesting about the difference between the version 2.0 and 3.0 in
terms of internal noise. I upgraded from a model 25 to a model 40 by
sending the unit back and having the board replaced. Now it's a version
2.0. They told me that they wouldn't modify it further!

> class.

Yeah and so? Just as a data point. I'm looking at getting a no-code tech
license. Of course, I have no interest what-so-ever in talking to anyone
over radio. I want to play with spread-spectrum and radio controlled
Airplanes, maybe with telemetry. Do you really want to force me to learn
code for this?

I'll say the same thing I said on the ham group. Why do you want to limit
your membership via a pointless skill? If you really want to do something
useful make the test a non-gimmee. Currently all the test answers are
published. If you want evidence of actual interest make someone work out
antenna specs. Make someone design a simple oscillator. Do something of
real world value, not some bogus, "Well when I did it" type of pointless
initiation. Get a grip. If morse is your hobby, and you want to reserve
parts of the spectrum for those that have demonstrated proficiency in
morse that is fine. Don't force someone who wants to set up a computer
repeater to learn a skill that is of absolutely no use to him. I get the
feeling that the "must learn code" group falls into two catagories: the
aforementionned "I did it so you should" and those that are afraid if
real testing is implemented they would fall on their faces.

> supplement the data terminals, and for "special" situations.

Aha. Many "ram-raiders" (no longer happens, really) over here used scanners as routine, apparently. So, if you've got all these data channels over there, then there really can't be /that/ much to listen to, unlike I previously thought. I suppose all the info is encrypted before being sent? Otherwise I would have expected to see more messages about software/hardware to read the info.

It's strange, once again. The only programmes I ever get to see in Great Britain, regarding American police are "Cops","Rescue 911", and "LAPD". On all fo these programmes, I see the MDTs, but most of the communication seems to take place over the radios.

I can see that in situations like, car pursuits, the radio is much more useful :-) I am having visions of some poor officer having to type in exactly what is happening, as it happens! I couldn't type that fast :-)

Oh yeah, one other thing before I go. I saw on Cops once a chase in which the police used a CB to ask a truck in front to help block a vehicle. Do they carry CBs as routine? I thought it a bit strange that it happened.

Anyway, better go :-(

Bye for now.

What are your desires? Mainly Patrol & Police? If so I'd recommend a Uniden Bearcat BCT-7. Fairly compact, does Highway Patrol & local Police "Service Scan" by state, allows 100 user programed frequencies, has "CB Scan", plus a alert that picks up on patrol cars' vehicle repeaters.

A friend that I travel with has one and it works SUPER. Just change the state when you cross state lines!

>: setting other than the signal's true frequency. It's very common for
>: blocked scanners to receive cellular this way.

>No, it's not "image reception." Cellular phones have an input and an
>output frequency, both being separtated by 45 Mhz. You are hearing the
>other frequency, whether it be the output or input.

That's a fine explaination, but how do you account for the information in
the original post? He said his cousin's scanner receives the same cell
call signals 43 Mhz below, not 45 Mhz?

It could very well be an image if the first IF of the scanner is 21.5 MHz.
And as we all know, images are very common in scanners.

Curtis

2492. Anyone know mods for Radio Shack Pro26 or Pro2042 Scanners?

Newsgroup: rec.radio.scanner

Speaking of Uniden Customer "Sevice,"
Let me relate my experience last year

On May 22, 1995, I placed an order for $85.47 worth of battery packs and AC
adapters for my BEARCAT 3000XLT plus Blue Label Two Day shipping. I used my
Visa Card and Uniden posted the authorization the following morning (according to
VISA).

On May 23, 1995, I spoke with someone who I believe was named Joe at Uniden
Customer Service. I told him that I needed to change the shipping address on the
order I had placed the previous day. He told me that the only way was to place
a second order and to cancel the first one. So, I agreed. He took my Visa card
number and expiration date and placed a second order. He called back a little
later and advised me that the first order had been successfully stopped. He said
that the first order hadn't left shipping yet. That evening, I wanted to use my VISA
card for something else, and, I was $3.00 OVER MY LIMIT! Uniden had charged
me twice for my order.

The next morning, now a Wednesday, I spoke with Bill at Uniden Customer Service
at 9 A.M. He said he would try to take care of it. But, he did not seem to
understand my problem. He told me he would call me back.

Later thad day, I tried to contact Bill at Uniden again. At 12:10 p.m., Rhonda
advised that Bill was unavailable. Also, she would not allow me to talk directly to
the credit card refund desk. She said that it was not for incoming calls and she
attempted to relay the information between myself and the credit desk. I gave her
the same information that I had given Bill three hours earlier. Rhonda asked me if

I could have Visa send Uniden a statement by fax showing the dual charge. Well,
I had already spoken with a very helpful lady at Visa who gave me her direct
phone number and told me to have Uniden call her. I advised Rhonda that Visa
wanted Uniden to contact them directly, and I gave her the number.

At 1:15 p.m., nearly an hour after speaking with Rhonda, I rephoned Visa. The
lady at Visa with whom I was working on my ordeal advised me that no one from
Uniden had called yet. She asked me for Uniden's number and said that she
would call them herself!!

The Visa lady called me back a short time later and advised she had spoken with
a Molly about the problem. She agreed with me that the people at Uniden were
a little confused. Molly told the Visa lady that I had only been billed for one
$85.47 order and that there was NO RECORD at Uniden of a second $85.47
order---then why was it on my Visa?? Visa told me that since Uniden only showed
me with one order, and not two, that they would remove one of the $85.47
charges. The lady at Visa warned me, however, and advised the to check my
statement when I received it; if Uniden reposted the second $85.47 charge -- the
one that Visa themselves deleted -- onto my account, then I should call Visa's
customer service and dispute the charge. Did Uniden repost the deleted charge?
You betcha.

On 6-2-95, I received my statement from Visa with the two $85.47 charges and no
credits! I phoned Visa and disputed the charge.

On that day I was finally able to speak directly with a Uniden Customer Service
Supervisor who read a summary of my troubles similar to what I have given here;
I gave her my Visa numbers, etc. She appologized a lot, gave me her personal
extension number, and advised me to speak directly with her if I ever needed
anything again. I guess I would appologize too if Visa were preparing to take
money out of my company's account because of my apparently poor

supervision!
The supervisor at Uniden said that she would see to it herself that I
was credited
with $85.47! Finally, after my nightmare, Uniden customer service came
through.

Oh yeah, another experience with Uniden Customer Service.....

I was complaining about the XLT3000's reception of the 900+ MHz pager
frequencies in the 815 MHz area. I hounded a particular customer
service
representative for two weeks about the problem. I had tested the 3000
against an
older Radio Shack dual-conversion scanner and another Uniden! The RS
scanner
and the different model Uniden picked up silence on the 815 MHz
frequencies
while the Uniden's speaker was constantly spilling out the wonderful
sounds of data
transmissions. She told me that one could not compare a dual conversion
RS
scanner against a triple conversion Uniden Scanner. I tried to convince
her that
would be true in reverse! However, in this situation, if there were
true
transmissions on the 815 MHz, any scanner should pick them up -- no
matter how
many conversions!

I tried to convince her to conduct the same tests that I had done with
the 3000. I
figured that Indianapolis would have a lot of pagers in the 900+ area
(or 815
MHz on the 3000XLT!) Well, after the end of a week, she still had not
conducted
the test - so - I gave up.

Uniden's 3000XLT's image problems are the worst that I have ever
experienced with a scanner. However, at least the cellular freqs. don't
image on the public safety trunking. That's the main thing I was
looking for in a new scanner. But, I am now tired of having celluar
images in the Military Air band. the 450-460 MHz band, and on the lower
end of the 1000 MHz area. Not to mention the countless .91 MHz away
images in the VHF Hi band. Oh yeah, by the way, the 200 channel Radio
Shack version of the 3000XLT had the same problems when I tested it.

HAMFEST/COMPUTERFEST CALENDAR 1996 - NORTHERN ILLINOIS
last updated April 24, 1996 |

o Please report additions or changes to Bob Parnass,
AJ9S, office phone: (708)979-5414, electronic mail: |
parnass@bell-labs.com. Thanks to Dennis Dale and ARRL
for providing information.

MAY

May 5 (Sun), Sandwich, IL - DeKalb Hamfest. Sandwich Fair-
grounds, intersection of Suydam and Gletty Roads, just north
of Rt. 34. Admission $6 at gate, free parking. Talk-in on
146.73 MHz and 146.52 MHz.

May 11 (Sat) - Kankakee Area Radio Society, Peotone, IL.
Will County Fairgrounds, I-57 to exit 327 east. Admission
$5 at gate, free parking. Kids under 12 free. Info: Willis
Bowser, K9IFO, 1210 North Riverside Dr., Momence, IL 60954-
3452, tel. 815-472-2079

May 26 (Sun), Chicago, IL - Chicago ARC Hamfest. DeVry
Institute of Technology, 3300 N. Campbell. 8 AM - 3 PM,
setup at 6 AM. Admission $5 at door, free parking. Kids
under 12 free. Talk-in 147.255, 444.825. Info, call |
(312)545-3622 or (312)486-6823.

May 26 (Sun) - Computer Central, College of DuPage (see
notes at the end of this article).

JUNE

June 2 (Sun), Princeton, IL - Starved Rock RC. Bureau *
County Fairgrounds. Admission $5, free parking. Info: Deb-
bie Burton, N9DRU, 1153 Union St., Marseilles, IL 61341-
1710, tel. 815-795-2201 Usually an excellent hamfest, with
sellers from Illinois, Iowa, and Wisconsin.

June 9 (Sun), Granite City, IL - Egyptianfest '96, Egyptian |
Radio Club. Granite City campus of Belleville Area College, |
1/2 mile south of I-270 on Ill Hy 203 at Maryville Road. |
8:00am to 1:00pm CDT. Annual hamfest, computer fair and |
fleamarket. VE session, food and drink, indoor dealer / |
exhibitor area. Talk-in 146.79 MHz. Info: Egyptian Radio |

Club, P.O. box 562, Granite City, IL 62040, call Bill Dusen- |
bery N9OQK at (618) 398-1456. |

June 30 (Sun), Wheaton, IL - Six Meter Club of Chicago. |
DuPage County Fairgrounds. Gates open 6 AM. Admission $5
at gate. Talk-in on 146.97 MHz (107.2 PL) or 146.52 MHz. |
Tickets available from Mike Corbett, K9ENZ, 606 So. Fenton |
Ave, Romeoville IL 60446. 24 hour hotline for info= (708) |
442-4961. Good hamfest which moved from Santa Fe Speedway |
to Wheaton this year.

Jun 30 (Sun) - Computer Central, College of DuPage (see
notes at the end of this article).

JULY

Jul 13 (Sat), Oak Creek, WI - S. Milwaukee ARC Swapfest.
American Legion Post 434, Shepard Ave. Admission $5.
Talk-in 146.52 MHz. Info (414)762-3235.

Jul 14 (Sun), Sugar Grove, IL - Fox River Radio League.
Waubonsee Community College, Rt. 47 at Harter Rd. VEC test-
ing. Admission $5 at gate, free parking. Info: Diana
WD9API, (708)293-7485. Fair, small to mid-sized hamfest.

Jul 27 (Sat), Pecatonic, IL - Rockford ARA Hamfest. Winne-
bago County Fairgrounds. VEC testing at 1st Baptist Church,
7th & Washington. Admission $5. Kids 10 and under free.
Info, Marsha Plasters (815)399-9233 or Diana White
(815)645-8545.

Jul 28 (Sun) - Computer Central, College of DuPage (see
notes at the end of this article).

AUGUST

August 18 (Sun) - DuPage ARC, Stickney, IL. DuPage ARC Ham-
fest Computer Show. Hawthorne Race Course, 3500 S. Cicero
Ave. Air conditioned exhibit hall for dealers. Outdoor
fleamarket spaces free. 8AM - 2PM. 6 AM setup. Admission
$5. Kids under 12 free. Talk in 145.25 MHz. Info: Ed
Weinstein, WD9AYR, 7511 Walnut Ave., Woodridge, IL 60517.
tel: 708-985-9256.

August 25 (Sun), Woodstock, IL - Tri-County Radio Group.
McHenry County Fairgrounds, Rt. 47. Admission $5 at gate,
free parking. Kids under 12 free. Info (voice/fax)
(708)658-1678.

August 25 (Sun) - Vermilion County ARA, Danville, IL. Info:
Gary Denison, KA9SKS, 14704 East 2750 North Rd., Danville,
IL 61834-5610. tel: 217-759-7389.

August 28 - 30 - Antique Radio Club of Illinois, Elgin, IL. RadioFest96. Holiday Inn Holidome and Convention Center, 345 River Road, Elgin, IL 60123 Ph. (708)695-5000, (847)695-5000 After 01/20/96. Info: Jeff Aulik, 1708 Parkview Ave., Rockford, IL 61107 or Carolyn Knipfel, RR 3, 200 Langhorn, Morton, IL 61550.

SEPTEMBER

September 8 (Sun) - Bolingbrook ARS, Joliet, IL. Info: Ed Weinstein, WD9AYR, 7511 Walnut Ave., Woodridge, IL 60517, tel: 708-759-7005

September 13-15 (Fri, Sat, Sun) - Peoria, IL. ARRL National Convention. Info: Ron Morgan, KB9NW, PO Box 3508, Peoria, IL 61612-3508, tel: 309-694-2649

Sep 21 & 22 (Sat & Sun), Grayslake, IL - Chicago FM Club Radio Expo. Lake County Fairgrounds. Starts 6 AM. Buildings open 8 AM. VEC testing. Info, (708)457-0966. Usually one of the best hamfests in NE IL.

Sep 29 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

NOTES - Computer Central shows

Computer Central computer shows are held at the College of DuPAGE, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 708-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm.

: However, I have heard that two scanners, one scanning upwards the other
: down, helps alot. I don't have the budget for this at the moment.

Let's take this one step further - get a scanner for *each* frequency
and have it monitor the frequency, not scan.
Since you wouldn't have to scan, you wouldn't need expensive scanners
with all the bells and whistles. You could even use ones which are
broken and don't "scan".

I went to RS last night to buy an adapter for a Pro-41 I picked up dirt cheap at a local pawn shop. I walked in, promptly rec'd service, and a few seconds later gave my money and did not have to reveal any unusual personal information. It didn't really sink in until I was out of the store that I was not asked for phone #, zip code, name, address, how many children I have...It was actually NORMAL. I have a feeling the manager was napping in the back and the salesman (who probably gets as tired of asking for that info as we get at giving it) decided to do things his own way...Bravo!!

It's sad when we get excited about these "pleasant" or "normal"
experiences, isn't it? Afterall, it should be like that all the time!

PKH

2513. **Ram 4 Sale**

Newsgroup: rec.radio.scanner

Cross-posted to: rec.radio.swap,comp.sys.laptop,rec.radio.scanner

I have 6 four meg boards, 5 of them are non-parity (70ns) and 1 of them is non-parity (80 ns). I also have an 8 meg board (70 ns) that is non-parity. The memory is almost new, it was used for about a month on a project I was working on. (72 Pin)

I prefer pre-paid, I have had a couple of problems with cod. I understand ram has come down in price, so I am willing to accept any REASONABLE offers (not gunna give them away) or GOOD trades.

Thnx Tony

2514. How to Find Scanner Frequencies

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call, published each year in 9 regional
volumes by Hollins Radio Data, and sold at Radio Shack and
larger book stores for under $13. Police Call is basically
a computer printout of FCC license information in the fire,
police, local government, and conservation services in two
lists: by licensee name within state, and by frequency.
Later editions have included a few pages of local airport
and nonsensitive federal government frequencies. The 1996
edition contains selected business frequencies, too, but
callsigns are listed only for local government and public
safety licensees.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local

agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information

fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 50 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA. The RCMA electronic mail address is RCMAHQ@GEnie.com.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto

terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s]

missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

I have both and love the setup. When I first got the scout, I thought it
didn't work, but after a few days of figuring it out, I realized that
it works on NEAR-Field RF. Don't be fooled that you will be able to tune
in on the guy across the street using a hand-held radio.

I and many others have added mini-stereo jacks to our 8000's to connect
the scout directlty to the scanner without using the small adapter that
is below the battery compartment.

The Scout/8000 combo is perfect for those long traffic delays (I live in L.A.)
Just about everyone has a cell-phone and if I stay in the middle lane, the
scout will get hits from cars on the opposite side of the fwy.

Make sure you get the new version of the scout that has an auto-sleep feature.
This feature automatically saves the frequencies in memory when the unit
is turned off. Older units require that you hold a button down for a couple
of seconds before you turn the unit off.

Hope this gives you a small insight....

Steve

Harry, when you got a Bearcat from the UK, did you have problems with
the UK band plan as opposed to the US? Which unit did you get, and was
it powered with a 12VDC supply or line current? Can it change frequency
step size (i.e. 30 khz)?
I assume no blocks.
Thanks in advance!
Jim N2ZZ

I have the BC890 and it has most of the main features that the more expensive rigs have. They look almost identical. I also have moded it for complete coverage. The BC890 is almost half the price. Also Radio Shack parts fit it including the ctcss board which is about half the price of the Uniden part.

I would agree, that the digital transition is for the better.
But, not the encryption that will also be used. Given enough time and $
the digital would have been cracked. I doubt it with the encryption.

Hey,

There is also a airport information WWW site that gives frequs. used,
along with a lot of other information. Can't remeber the URL though,
Sorry:(. Try searching under airports.

For Sale Bearcat 200xlt. Brand New condition. I bought it about a year ago and never really used it. The display still has the plastic protection sticker on it, that's how little it was used. Scanner comes with carrying case, antenna, charger, and battery. It is a stock radio but it does receive all the 800's with out any mods.

Asking $200
If you are serious about the scanner send me e-mail with you phone # and I will call you with more info. (I'm not a weirdo so don't stress out!)

I'm looking for a new handheld scanner to replace my RS PRO-38. I would like something which receives the 800 mhz freqs as well as aircraft and which would have 50-100 channels.

I've tried the Sportcat which I returned because the nicads did not seem to keep a charge very long and you can't use alkalines in it. I also tried the PRO-62 and found that its performance on my favorite band (railroads) was inferior to my old scanner.

Any suggestions?

Thanks!

Jerry

: |can be descrambled with the Ramsey SS-70 speech descrambler.

: Actually, if you already own a SW receiver equipped with SSB capability,
: and a CB radio (or signal generator, old 27Mhz walky-talky, etc.), you
: can decode the inverted speech. Simply feed the inverted speech audio
: into the CB set or modulation input of the signal generator (AM modulation
: is a must!).

Cordless phones use FM. You need to demodulate the FM before demodulating
the inverted speech, so any scheme with an SSB receiver ain't going to work.

Hi, I'm a newbie to scanners and need opinions. Someone gave me a broken PRO 31 (it makes no sound and only the top half of the LCD shows when powered up). My question-Would it be cheaper/better to buy a new scanner or pay to repair the old one? I thought it might be possible that it was such an old model that some unique and/or interesting Mods were available for it that might not be possible with a newer model. Or is it simply an old broken model that I should trash, knowing that it would be less trouble to buy and modify a brand new unit?

TIA

IMHO,

Converters are way too much work! Too much extra bulk and 'dongles'.
I'd sell any 'unfriendly' scanner and buy one I KNEW would receive
the frequencies I wanted and upgrade while I was at it.

How about this, what becomes of signals desired that are within the
range of the scanner but your converter is in-line and ON? That is,
your 900 Mhz converter is on, there is a desired 450 MHz mobile signal
on the air and your scanner zooms past the same activated 450MHz
frequency on your scanner. Will your converter 'pass' the desired
signal?

Also, don't forget that (almost) everything you add in-line
presents a measure of LOSS, expressed as, "Insertion Loss" and in
-dB's (in most cases, any -db is bad!). This even includes coax
connectors! In other words, how much loss will that converter
present to very weak signals passed thru it? I doubt if the
converter offers broadband pre-amplification, but it may.

Motorola Type II trunk systems only use an access tone from the user,
it is a non-standard PL only if you are thinking of conventional
systems, otherwise to the trunked community it is standard. No tone is
generated by the system, the control channel and talk groups programmed
in radio determine if the radio unmutes or not.
As to DPL with Motorola Trunking system, I am aware of no motorola radio
that will allow a DPL tone to be programmed in the trunked mode, only
conventional. However once again this is type II, Type I trunking is no
longer a Motorola supported product.

| >: > region of the spectrum. In fact, some of my police freqs will pick up cell
| >: > calls depending on what city I'm in!
|
| >Most of the time the trunked frequencies are NOT in the cellular band,
| >they are just below it. Cellular is from 825-849, 869-894. Trunked
| >radios are a little BELOW both these ranges.
|
| The trunked/conventional 800 Mhz channels for part 90 systems (such as a
| fire/police department) are different from cellular all the time.
|
| 800Mhz PLMR channels for base stations are from 851 Mhz to 869 Mhz. The
| mobiles transmit 45 Mhz below the base stations (806-821). None of these
| frequencies are in the cellular service.
|
| 900 Mhz systems have base station channels from from 935 Mhz to 940 Mhz.
| The mobiles transmit 39 Mhz below the base stations (896-901).
|
| If you are hearing what you think are cellular calls on these
| frequencies, you are probably hearing images.
|
| Curtis
|

Some SMR systems are interconnected, and if the mobile is full duplex it
can sound just like a cell call. As a matter of fact one company, who
baught up a lot of 5 and 10 channel systems billed themselves as the
"next cellular system" and the plan was to not offer dispatch service
but to ONLY offer interconnect service (NexTel) however I think (not sure)
that that they have changed and are now offering dispatch as well as interconnect service.

cslye@infosite.com (Cameron Slye) wrote:

>Does anyone have problems with this scanner and intermod ?

Under some circumstances, YES! It is, after all, a double-conversion design, so it can be "bullied" by strong signals into producing all sorts of images.

When used at home, I don't have the problem much however if I get within a 1/2 mile of a cell-site (when mobile) I can pick-up cellular phone calls on both the 450Mhz band and the 800Mhz Public Safety (trunked) band. Paging transmitters are especially bad, and are big offenders too.

I use a 19" whip on the car, and an INDOOR whip right off the back while at home. I might have more problems with this if I used an external antenna (but I haven't tried it).

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S |

[NOTE: The first version of this article appeared in the |
RCMA Newsletter, December 1988. It may not be reproduced |
in whole or in part on CDROMS, in bulletin boards,
networks, or publications which charge for service without
permission of the author.]

The squelch control in some FM monitor receivers is
difficult to use because of too much hysteresis. The
American Heritage Dictionary of the English Language
defines hysteresis as the:

o "Failure of a property changed by an external agent
to return to its original value when the cause of the
change is removed."

It's like having play in a car's steering wheel, or
backlash in a gear set. Too much hysteresis in a squelch
circuit forces one to keep the squelch at a tighter
setting, missing weaker signals when scanning or searching.
The squelch hysteresis problem was first addressed in a
1984 article about the Radio Shack PRO-24 crystal
controlled scanner.

Why do engineers design these circuits with any hysteresis?
Basically, hysteresis prevents weak signals from "popping"
the squelch open and closed rapidly, which would be very
annoying to the listener. A squelch circuit with hysteresis
requires a stronger signal to open the squelch than it does
to keep it open.

Models cursed with too much hysteresis include the
Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003,
PRO-2004, and others. Don't despair, the fix is simple for
most radios. I've successfully reduced the squelch
hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback
from the squelch gate input to output, through a resistor.
The higher the resistor value, the less feedback there is,
and less hysteresis. My modification involves replacing the

"stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden | models, because the squelch hysteresis is partially | determined by firmware inside the processor IC. |

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

>>and start typing.....", "When is the next pass of RS-232 ?...." "I
>>don't want to KISS it I just want to connect...." Yea we all know you
>>understand CODE.....

>No, but a practical knowledge test on networking wouldn't be out of the
>question, now, would it ?
I think that is what I was saying if you didn't read into that.

>The proper operation of a packet station,(which
>is required) the installation of a tnc and software, and general computer
>knowledge wouldn't be too much to ask, now would it ?
I am not against any of the ideas you present I am just against code.
How many TNC control codes do you know with out looking them up ?

>You need to know
>baud reqs, bw, and other things in order to obtain your amateur ticket to
>use packet on 30+ bands, so why not make the reqs a little steeper for
>that.
Yes you are correct on that one....

>Don't you feel that you had to learn anything in order to operate
>your own packet station ?

No and that is the problem

>Does that separate you from the crowd on inet,
>because you have or can obtain special privs other people don't have, like
>use of amprnet ?

I am sorry you missed the point of my comments.

>Have you ever run a tcpip node hookup to the inet, and
>retransmitted amateur radio sigs to a commercial carrier, and vica-versa?

No, nor do I have a desire to do so.

>That's a very special priveledge, something no other class of computer
>operators have, outside of commercial.

>And lastly, did rs-232 just float
>up there on it's own,

Maybe the explanation of RS-232 should be on the computer operator
test,

>or did someone have to pay for it, and then build
>it, and launch it, and make trajectory calculations for it, and write
>compter tracking software, and packet progs, just so us tech and tech+
>types could hook up our computers to it, and use their equipment, and it's
>limited resources ?

And I suppose that CW helped all of that. And that the launch of a
sat. should still be calced with Vac Tubes because we have a history
with them. (Sorry the FAA still runs the US air system on them)

>I don't know about anyone else, but I can't name any
>other hobby in existence that would do this for us, especially when
>there's no real money involved. Have a good day. 73.

That's funny. I have a friend who says the same thing. Claims he never had a social security number, claims he has never filed a tax return or paid any taxes at all, and feels that he is justified. Funny thing is, he just recently filed a suit against the US Govt for malpractice in the use of an experimental drug used in the treatment of epilepsy. Epilepsy he acquired after falling down at a student worksite and hitting his head while he was drunk. Seems he wanted the Govt to come up with a lump sum payment, so that he could just get on with his life, and not have to worry about answering to the Govt. who is currently paying him disability in monthly payments. Weird, someone who doesn't believe he owes the system anything, can swear in the same breath that the system owes him everything, and he should not have to be responsible to them in the least.

What frequencies are the Sky Phones by Bell Mobile on. I know of two AIR PHONE frequenciy ranges. One is 894 to 896 MHz and the onther is in the 454 MHz range.

My problem is that I know the planes landing at my local airport have a "Sky Phones" by Bell Mobile but I can receive anything on the frequencies I gave above so they must be using different frequencies.

I heard of AEROPHONES but this Sky Phones is new to me. Anyone else know of this and what frequencies they are on?

Actually, I recently had to replace my NiCads (2 packs), I just cracked the case, went down to a battery store and had them custom make a couple of packs. It cost me about $30 ($15 each), but I got better batteries and an extra 100mAh! This thing will last about 2 solid days (contunious).

Actually there is a software/hardware combination that is available
and inexpensive. The program is called pocsag. You can download a
shareware version and it will let you decode all the pages you want
for something like 5 minutes. Of course, if you register, the time
limit goes away. The software has lots of options for decoding

including numeric, alpha numeric, 300, 1200 or 2400 baud, and more.

There is a schematic, parts list, circuit description, etc... in the docs for the software. Nothing fancy. Just hooks into your serial port.

This program is known to work. Check it out.

It is available at

ftp://ftp.demon.co.uk/pub/ham/scanners/pd-200.zip

Also I just noticed he now has a pager ENCODER. Guess I'll have to d/l it and check it out.

-Karl

Hi,

Just bought my first scanner, an Uniden SC 150B.

Are there any modifications that can be done to this model to
"enhance" its performance?

If so, where would you suggest I get them done?

If possible, please E-mail me direct!

Thanks, Rich

: I need help understanding cordless phone security. I have seen phones
: advertised as having built in scramblers, higher operating frequency
: (900MHz), or both. I have also seen the 900 MHz phones advertised as 2
: different classes. One less expensive class is said to incorporate an
: "analog" component in the voice path (I do not understand). The other
: more expensive class claims to have a 100% digital signal, enhancing
: sould clarity, and security.

The analog signal will thwart most scanner listeners, the 100% digital signal signal will thwart all of them. The analog signal descrambler is something which is fairly easy to get, but most eavesdroppers won't bother because they can just listen to someone else. If you put a cheap lock on your door and everyone else on the street leaves their door unlocked, you probably are not going to be burgled, you know.

The digital signal is totally un-scannable. These cost at least $250. Be sure that the phone uses spread spectrum. The term "digital" can appear in the literature of phones which are not truly digital.

Regardless of whether the government owes your friend the money,
he's not wrong to accept it. A violation of rights only exists
when money that isn't due is taken without permission or through
the use of fraud or force. Unless there's more to this story than
I know, the only party who's done that is the government.

Hmmm, seems like your friend has developed the dependence I
mentioned earlier. Imagine that. ;)

>45!

I think you and your cousin are both receiving images, given what you have described here. One of you must a 10.7 MHz IF and the other must be 10.8 MHz. You have "low side" injection (your local oscillator runs 10.x MHz below the displayed frequency). Your cousin has "high side" injection (his LO runs 10.x MHz above the displayed frequency).

Want the math?

Assume scanner one (your's) has low injection for a 10.7 MHz IF.

Two times the IF = 21.4. And 906.5375 - 21.4 is *885.1375*.

Assume the other scanner (your cousin's) has high injection for a 10.8 MHz IF.

Two times the IF = 21.6. And 863.5375 + 21.6 is *885.1375*.

So. A logical explaination is that you are both hearing images of 885.1375. If you swap the IF freqs it would be 885.3375 that you are hearing.

Check the specs on the two scanners. I'll bet one of them has a first IF of 10.7 MHz. And the other one has a first IF of 10.8 MHz.

Could be wrong. But it seems the math adds up.

Curtis

Gee guys, nobody even took a wild guess that this might be a forgery??
Well it was.
I am a happy sort of guy though.

There were a number of these type of messages put on other newsgroups
also.
The curious thing was an hour after a conversation with my ISP I
received a
call from the Special Agent in Charge of the Seattle FBI office and
then one
from Portland. They wanted copies of all the postings forged in my
name sent
to them. All they would say is doing things over the modem is the same
as
through the mail. Like the feds are going to defend my honor, ha!
The
feeling I got was the feds are collecting goods from the internet to
build a
case for censoring the net. Not a pretty thought.

Sorry for the distraction away from motorola business radios and such.
To the
others, sorry but I am still happily married to the same female I
married many
many years ago and the only young man I would ever care to kiss is my

son. :-)

|>Does anyone have problems with this scanner and intermod ?

|Under some circumstances, YES! It is, after all, a double-conversion
|design, so it can be "bullied" by strong signals into producing all
|sorts of images.

That's a non-sequitur; being double-conversion has NOTHING to do
with the intermod problem. It has everything to do with the
design of the front-end filters, RF amplifer and mixer.

|I use a 19" whip on the car, and an INDOOR whip right off the back
|while at home.

I have a Uniden BC-760XLT which is pretty close to the PRO-2026; the
pager intermods are so bad that during weekdays in the daytime I resort
to using a paperclip as an antenna; during the weekends the pagers
aren't as active, so I can use the indoor whip.

|You flushed your money down the toilet. That is speech inversion and it
|can be descrambled with the Ramsey SS-70 speech descrambler.

Actually, if you already own a SW receiver equipped with SSB capability, and a CB radio (or signal generator, old 27Mhz walky-talky, etc.), you can decode the inverted speech. Simply feed the inverted speech audio into the CB set or modulation input of the signal generator (AM modulation is a must!). What comes out of the CB set or signal generator is an AM signal, which as we all know is really a Double Sideband Transmission (DSB) with a carrier. You can receive this AM signal in the SSB mode on the SW receiver; however, instead of using the LSB or USB to decypher the "correct" sideband, you use the opposite mode. This will flip the audio frequencies and allow the you to have intelligible speech.

> 45!
>
> --
> -Dave
> =====
This still isn't right. 906.5373 is not a valid cell frequency, and neither
is 863.5375.
I'd bet that you both are receiving images, probably of a frequency very near
884-885 MHz, which *is* a valid cell freq. Your scanners in all likelihood
use different conversion schemes (one up-conversion, and one down-conversion)
to get that 43 MHz spread.
In fact, I can even tell what the IF involved is. 43/2=21.5, as the average
of your two IF frequencies. Since there are very common IF's at 10.7 &
10.8 MHz, and doubling those and adding them together is 43 MHz, I'd be
willing actual cash that this is the answer to your question.
If you checked, your friend's scanner, and your scanner, would, between
them, have an IF of 10.7 & 10.8. The math shows: 10.7 * 2 = 21.8;
10.8 * 2 = 21.6. 21.6 + 21.4 = 43. Dead on. Both are images.

I don't think the primary motivation of radio upgrades is to thwart scanner listeners. It's just that the two-way radio systems are inadequate for a large, modern police force. The police need a more effective way to communicate which involves MDT's, trunked radios, digital radios. The fact that scanners can't pick these up is only a minor factor in the decision to deploy these systems.

If you mean the Rayovac Renewals, they are good choices for a scanner but you must use the dedicated external charger, and NOT charge them in your scanner (they will leak).

>Also do they make any NI-MH AA or AAA's?

There are several varieties of NiMH penlite (AA) cells. Typical capacities of 1000-1200 mAH. They self-discharge at 3-9% per day, so leaving them in a scanner (especially one which trickle drains the batteries for memory backup) is not a good idea.

I used to own a PRO-2026, but ended up taking it back due to the pager, cellular and some business radio (I'd pick up landscapers asking about what sidewalks required shovelling, and some deli delivering food all over the 400 Mhz public service freqs).

The main difference between the 2026 and 760XLT is that the Bearcat can add the pre-amp and PL board. I always wondered if adding these on would have fixed some of the problem. Do you have these installed?

Does anyone know of any available articles or have any experience with intercepting and decoding modem transmissions via radio. Particularly the reception and decoding of a 2400 baud line "conversation" recieved by a scanner. This system would be a forced listening type and would convert all transmissions into plain ascii text. I have experimented and failed in attempts using an acoustic coupler attached to the scanners output. I have been searching for a circuit that would immulate a telephone line in which I could supply onto it the recieved audio and using a modified terminal program forced to "listen" decode the transmission.

Hi everyone. I have a few questions that I'm sure that the majority of you can answer. I'm not a ham (yet) although I do have a transciever that I use for scanning. Please a take a moment to answer my questions. Multiple replies with basically the same answers are fine, I've found that usually one or two people can articulate their thoughts better than others.

How does Frequency Modulation work?

I am to understand that signals on
certain bands have a certain bandwidth. For instance, on 140mhz, the band is 5 khz, right? That means that only ONE complete 140mhz signal can exist in every 5 khz step. ie a signal could exist between 140.0000 and 140.0049 and a different signal 140.0050 and 140.0099 simultaneously. However, a complete simultaneous signal could not exist between, say, 140.0000 and 140.0049 and a different signal between 140.0025 and 140.0075. Correct?

Now, whenever I think bandwidth on the internet, I think, how much data can be transported at one particular time?

How is this related to bandwidth of a frequency? Is there a maximum limit on how much data can be sent in say 1 second over a frequency? Internet 'channels' (ie w/ protocols, etc) are DIGITAL (ignore the fact that the PHYSICAL lines might be analog) for instance might be able to send say 100,000 bytes per second. Now how does this relate to bandwidth for a frequency? What would be the unit of measure for this? The real question is HOW MANY DISCRETE SIGNALS(ie one signal can be distinguished from the rest) exist? And how many of these discrete signals can be sent per second?

How does a transmitter convert a voice into a signal to be transmitted?

How does amplitude, pitch(another word for frequency??), and volume come into play? How do waves play a role in the big picture?

From what I've seen with digitizers for computers, speech is just a wave, the amplitude(heighth of wave) indicating the volume with waves closer together indicating a higher frequency. Whenever I say closer together, I mean less width or more waves passing a point per second.

Does the radio actually look at all 5khz freqs(from my previous example, 140.0000, 140.0001, 140.0002 .... 140.0048, 140.0049) and check EACH one for a frequency? ie frequency counting EACH signal on each frequency.

Ahhh. I better stop now.

I'd very much appreciate any intelligent responses. I need a solid base of knowledge so I can learn more.

Thanks!
Keith

Last June I found out that the only way to watch a race is with a scanner. It was at NASCAR's Michigan race.

I fought my way through a crowd of 3 and 4 deep at the Racing Electronics trailer and bought a Uniden Sportcat.

I couldn't believe how many people were scanning at the race. At least half the fans in our section had them.

In July I took my scanner to the Molson Indy in Toronto. I got the most unusual looks when I doned my headphones. Some thought that I worked for one of the race teams (I wish) while others thought I was security. Where are all the race fans in Canada with scanners?

Even the circle track fans who follow CASCAR (Canada's version of NASCAR) don't scan. The drivers all have radios as well as their crew.

Any other Canadian race fans out there with similar observations.

I have a RS Pro 2006 in the with manuals in perfect working order. My interest has shifted to SW. I would to do a straight trade for Sony ICF 2010 or a Gundig 700. If the Sony has the Awai filters all the better. Please bear in mind I would like the Sony to be in simular condition to the Pro 2006. I would really like the manuals.

Please e-mail me at bobl@teleport.com

Dave:

The Uniden BC3000-XLT does a super job! Better than the Radio Shack PRO-26, which is said to be VERY similar, but the front-end circuits are different! Another one to check out is the Radio Shack PRO-60. It has similar features to the BC3000, but it's only 200-CH.

If you get an OKI900 cellphone and the CTEK package (cellular telephone experimenter's kit) for it, there are programs for a PC which will automatically follow conversations as they jumps, by following the tower commands. It can also track a specific MIN (the number of the cellphone) and only listen on specific conversations. (Great for PI's or vindictive ex's). Unfortuantely the company that used to make CTEKs (Network Wizards) no longer makes them, and the oki900 is no longer in production either.

The dope deals, for sure, are talked about on illegally cloned phones,
too. Scanners pick these up just like regular cellphones, but the cops
with their $30,000 monitoring devices won't be able to track exactly
who the phone is being used by, for sure.

I use my GRE Super Converter on my portable, connected between the radio and it's rubber duck ant. It adds less than 3 inches to the heighth and has a slide switch to bypass the converter if not needed. I don't know what it's VSWR is but I don't notice it. I group freqencies so I never have the converter switched in when scanning lower frequencies.

Here in Hillsborough County, Florida, there will soon be a switch to trunked communications system. The system, as all trunked systems do, will allow for greater flexibility and improved security in areas where local agencies desire them.

However, such a system also frustrates efforts to participate in citizen involvement in clearing crimes and providing information on hot calls involving local pursuits, special bulletins, and other non-confrontational information of use to local crime-watch programs; or just about any concerned citizen (the use of scanners by criminals is another debate, but not one which LE tends to take as a serious threat).

I am aware that some jurisdictions solve this problem by simulcasting police transmissions over standard VHF and UHF frequencies, and even over local cable channels. This is the highest form of community policing and I think any department that takes the time to reserve operation labor for this preservation is highly developed in philosophy and sincerity.

My questions are A) has YOUR department implemented these measures, and B) what grass-roots efforts can I make to ensure that Hillsborough County considers these options.

Thanks!

Dave

Source record: 234645

Thanks, Barry.

I have been hearing the same thing from others over the past several days. Indiana provides a clear exemption for ham operators, but Kentucky is rather "iffy." It seems as if Kentucky is the most restrictive state in the union with regard to scanner laws.

Here's my take: I believe ALL these mobile scanner laws are unconstitutional. How does a state legislature get off restricting your use...or, in some cases, even your POSSESSION of a radio receiver? Forbidding the use of a scanner in the commission of a crime and/or interference with emergency personnel at accident scenes is one thing, but where is the authority to prevent casual listening merely for hobby purposes. Nazi Germany and the USSR enacted similar anti-listening laws not so long ago.

That being said, I don't have the financial resources to fight such laws if I am stopped and my scanners are confiscated. Therefore, I will ignore the whole problem by traveling through Illinois instead of Kentucky. That means I will be spending my money...gas taxes, sales taxes, motel taxes, etc. in Illinois and not Kentucky. All because of a restrictive, and probably unconstitutional, law against listening to a particular type of radio receiver as I am passing through. Maybe if enough others would do the same, something would be done about nonsense like this. After all, money is the one "sound" that the politicians seem to hear.

Not putting a technical edge on it, analog can be monitored, and digital
can't, for the most part.
If you want security, use a hard-wired phone. If you want to keep the
average scanner user at bay, a digital cordless phone will do it.

>If this is true, is there someone way to get PL Tone on a BC9000XLT with
>800 MHz.

>Thanks in advance,

>JM

Hi Jeff!

Motorola's "connect tones" are as follows:

0 = 105.88 Hz
1 = 76.60 Hz
2 = 83.72 Hz
3 = 90.00 Hz
4 = 97.30 Hz
5 = 116.13 Hz
6 = 128.57 Hz
7 = 138.46 Hz

In some software/manuals they are carried out to two decimal places,
and in others they are only caried out to only one...

They appear to be "PL" and not "DPL".

They are used to access the RF channel assigned to the Talkgroup, and
are assigned system wide.

Hope this sheds some light...

>I want my Cable TV.......and CMT too....

>Check out our home page @ http://www.intersurf.com/~kleger

Kevin and Beth,

On Motorola Trunked Systems, there is a somewhat predictable channel
assignment pattern depending on:

1. The Control (Data) Channel of the day.
2. Whether a channel is:
a. Encrypted
b. Interconnect Equipped
c. "Protected"

-or-

3. Any combination of the above.

-and-
4. Programmed system "hang time".

On our system (12 channel), with no encrypted traffic or Phone calls
taking place, 5 channels regularly carry ALL traffic.

Now, when things get "busy", the phone equipped channels go into the
asignment mix followed by the encrypted ones.

I'm not sure where the protected channels stack up, as we don't
protect any of ours.

There's also a priority for "Data" capable channels, but we don't have any of these either.

There is also a priority for the assignment of phone equipped and encrypted channels within each type of group.

It's fun to sit at the system watch screen and watch things hop around!

Contrary to popular belief, some channels might not get assigned for days, if your system is never "busy" at a particular time, while other channels get LOTS of use.

Hope this helps some.

Z

hi,

Is it possible to decypt GSM cellular phone (it's numeric) conversation?
Is there a software who does it with a scanner?

thanks.

>Does anyone know what freq. the Bearcat 100 XLT covers? The only info I have on
>it is 11 band coverage. Does $90 sound reasonable for this radio new and never
>used ?

Basically, the Bearcat 100-XLT covers 29-50, 118-176, 406-512 Mhz. It
does not cover 800 Mhz and has 100 channels.

$90.00 sounds like a pretty good price. I know that the Bearcat
200-XLT, which covers 800 Mhz and has 200 channels generally sells
used anywhere from $150, up to $200 or so.

Hope that helps,

-Larry

I see quite a few postings asking where a particular piece of software can be found. I've asked this same question a time or two, so I'm not flaming anyone. But I have found the best source for this information. Point your web browsers to http://www.lycos.com . Based on my experience, this is the best search engine for specific files. For example, suppose you want to find the WXMAN 2.0 software. Just search for "wxman" and you'll get a long list of sites. For some reason typing "wxman200.zip" (the name of the file) doesn't work as well. It appears it treats the "." as a logical OR. I could be wrong, I've never read the help files for Lycos.

Ralph, maybe this info could be incorporated into the FAQ (assuming someone besides me READS the FAQ ;-).

>the UK band plan as opposed to the US? Which unit did you get, and was
>it powered with a 12VDC supply or line current? Can it change frequency
>step size (i.e. 30 khz)?

The UBC-3000XLT has full 760-1300MHz coverage.

I have not noticed anything different between a friends BC-3000XLT "bandplan" and mine although I have not had chance to compare them on a detailed basis. From what I can tell the bandplan appears the same on both. On the "800Mhz" the UBC-3000XLT defaults to 12.5KHz steps so I just manually change to 5KHz as there is no 30KHz step size. Its no problem and it works great.

The UBC-3000XLT comes with the standard Nicad pack and a Carry Case. All I had to do was sort out a 12v DC AC adaptor so I could charge the Pack. I have just bough a spare pack also.

Good Luck
Harry.

The closest thing to this I've seen is a handheld CB that has scanning
receive capability for CB channels. It may have had weather freq reception
as well, but definitely not 25-1300 MHz. It's hard enough to find a CB
with scanning receive! The unit I saw was a Uniden handheld, see their
homepage for details.

> I am seeking the opinions of users of the above.

I am using both. Both are very recent versions, so they're meant to be together quite nicely. I think other than the limitations that someone pointed out in range and the sensitivity to FM signals, it's a fantastic combination.

One thing I've found to be a slight annoynace is that linking them up really isn't worth it for small car trips...to really make the Scout useful you will probably want an FM trap of sorts...I ended up getting one from Radio Shack that works mostly okay ($4.00) but requires lots of cables and wires and converters between it and the antenna. Opto sells a notch filter for $100 which can be mounted directly on top of the unit, but makes you look really silly with it clipped onto your belt with the 8000 (let me put it this way, if you really walk around with both of those clipped onto your belt, you really must get a life).

Putting them all together in your car will probably require quite a bit of installation of cell phone holders and so on...it ends up looking really rediculous (even though the picture on the Scout manual makes it look so natural).

I'd probably use my Scout a lot more if:

1) It had a built in "lockout" for frequencies not to count...that way I could tell it to ignore the local FM station that swamps it (I can't run the unit at ALL without a filter).

2) A clever mounting system existed for this combination...

3) Better software existed to use with my CX12AR and Macintosh -- as it is I have to unscrew the CX12AR, flip a switch, run SoftWindows and very slowly download the list of frequencies into a mildly useless text file...

Just my view....overall I love the unit and really enjoy what it can do, but as I say, it's tough to use in practice without looking like a complete idiot.

George Davis (george_f_davis@aud.alcatel.com) wrote:
: I need help understanding cordless phone security. I have seen phones
: advertised as having built in scramblers, higher operating frequency
: (900MHz), or both. I have also seen the 900 MHz phones advertised as 2
: different classes. One less expensive class is said to incorporate an
: "analog" component in the voice path (I do not understand). The other
: more expensive class claims to have a 100% digital signal, enhancing
: sould clarity, and security. I would like to invest in a cordless phone
: with adequate security to guard against the average joe who tries to
: listen in on cordless conversations. Could someone please help me
: understand how vulnerable my private connversations are to being heard by
: someone other than the person at the other end of the line?

: Thanks for listening!
: George

There are five basic types of cordless phones being sold today:

49 MHz Standard -- These phones operate on a set of 25 frequencies in the 46/49 MHz band. It is very easy to intercept conversations on these phones, as nearly all scanners sold today are able to tune to these frequencies.

49 MHz Speech Inversion -- These operate on the same frequencies as above, but "invert" the audio transmitted between the handset and the base. This discourages the average scannist from monitoring your conversation, as, without unscrambling, your audio sounds like a russian duck on quaaludes. I've heard that you can train yourself to understand the audio without unscrambling by extended listening. To those who attempt this...get a life. Circuitry to unscramble the audio is both easy to put together and cheap.

900 MHz Analog -- 900 MHz refers to the transmission frequency. These phones transmit and receive in the range 902 - 926 MHz. Only the upper-end scanners can receive 900 MHz transmissions. Analog, in this context, simply means that the audio is sent with no scrambling...if your scanner can tune to the frequency, you will hear the conversation with no additional circuitry needed.

900 MHz Digital -- Same as above for frequency, but the audio is digitized. If you tune to a digitized conversation, you hear mostly hisses (and maybe a few beeps). The conversation is transmitted on a single frequency (as are all of the above), but (like most of the above) that frequency can change from call to call. Eavesdropping would require that the signal be intercepted and decoded. To decode the signal, you would need to know the digitization format...and this could vary from

phone to phone. In short (as I've said in another post) it would be easier and cheaper to connect directly to your phone lines where they either exit your home or come up into the phone company's punch-down block. Doing this would cost <$25 (unless you got caught!).

900 MHz Digital Spread Spectrum -- Everything I said about the 900 MHz Digital, plus, the signal is spread out over a larger chunk of frequencies (there is a type of spread spectrum where the transmit frequency actually shifts around during a transmission, but I know of no phone that uses this type). The advantage gained here is a greater ability to avoid interference from other equipment.

Of course, the ultimate protection is that it is now illegal to listen to cordless phone calls without permission from the parties to the conversation. :^) (Ref. USC Title 18, Ch 119 Sec. 2510, 2511)

Hope this helps.

I have an AR2515 2016 channel desktop scanner and I am looking to trade it to a portable AR2700. Coverage is 5 mhz to 1500 mhz, no blocks, continuous coverage with NFM, WFM and AM modes. RS-232 port included.

The scanner works good and looks good. I just need a portable with computer control.

reply via email or call me at 606-928-0110 evenings edst.

capacities
>of 1000-1200 mAH. They self-discharge at 3-9% per day, so leaving them in
>a scanner (especially one which trickle drains the batteries for memory
>backup) is not a good idea.

Two questions:

1) Are you sure these are NiMH batteries that your talking about? NiMH
batteries I have for my cell phones have a much slower self discharge
rate!

2) If you're sure about (1), where can you buy them and what are the brand
names you've seen?

Thanks,

PKH

:>
:>I am seeking the opinions of users of the above.

I just recently bought the scout and have been having a blast with it since day one. It's not hard to figure out, and is similar to a pager. The stubbie duck that comes with it works OK but I would also get some additional atennas. The stubbie duck is good for a broad range reception.

I would defiantely recommend getting the AOR8000. It will be the next thing I get, as it makes monitoring what you get hits from a breeze. I wish I had one when I went to a fair as I as constantly getting hits.

2642. Re: Private aircraft freqs?

Civilian aviation frequencies range from 108 to 136 MHz. This area is split up into two sections. 108-118 are navigational freq and would be pretty boring to listen to. 118 to 136 are voice communications; this includes 747s flying into LAX to the smallest Cessna. Some airports in quiet areas don't have a control tower but pilots tend to use unicom frequencies to keep in touch with eachother (around 121.6 - 122.5 usually). Military aircraft have their own band which is exactly twice the civilian freq (108 becomes 216 etc.)

: 3) Handheld type size 4) programmable200 channel memeory.

I think this is wishful thinking. You'll need a separate CB radio to actually talk on CB. However, these are quite inexpensive. Since you want the CB for emergency use only you might get one which has a temporary antenna you put on top of your car with a magnet.

2644. Pro-2026 Beep Silence (Pleeezzzz!!!)

I moved my 2026 inside as a 2nd scanner, and the beep is so loud, it has to go. How would I silence (or reduce) this beep?

I think the capacitors in the display board a prone to fail. This
happened on my IC-751.

Icom can sell you all of the caps. You can change them all before sending
it to Icom, see if it fixes it.

Yes, I'm sure. They differ with design, capacity, and age. Older designs
were worse with self-discharge. Also, the higher the density, the lower
the self-discharge rate.

>2) If you're sure about (1), where can you buy them and what are the brand
>names you've seen?

Gold Peak, Toshiba, Varta, Harding ("Quest"), and Golden Power are common
brands of AA-size NiMH cells.

I haven't ever heard of one that does all of the above. Its not possible.
They have scanners that cover the frequencies you list above. At best you
will have to get a CB and a Scanner.

>asking for that info as we get at giving it) decided to do things his own
>way...Bravo!!

I think that may be a new policy... I went to RS the other day and they didn't ask me a thing. I've always enjoyed getting the pimply faced kids at those places flustered by refusing to give them any info. In the past, I have had those kids having NO IDEA what to do when I told them I wouldn't give them info. One kid told me, "Well, we can't sell you this without giving me that info." I said, "Oh really? I wonder what the attorney general of the state would think about that." After explaing to him that because I was paying in cash, it was illegal for him to refuse to sell me the parts because I wouldn't give him any personal info.

Just yesterday I went into a Strawberries records to buy some blank tape. The clerk said "can I have your zip code please?". I responded, "No." She seemed confused by this, and responed, "It's just for a marketing survey." I said, "Yes, exactly."

Judging from the suprise on the clerks faces, I'm really suprised that more people don't refuse to give out personal info.

: Speaking of does anybody know hoe to modify a bc200xlt?

The new ones are impossible to modify. Ones more than 3 years old can be "fixed" by cutting a resistor. The 1994 regulation prohibits the sale of scanners in the US which can be modified in an easy way such as cutting a resistor.

I agree, I didn't quite answer the question he asked though. He asked
about intermod, and I started taliking about images (which has
everything to do with being double-conversion). Both are unwanted
operation and I made the leap in the wrong direction!

Beautiful!

Just for confirmation - the friend's IF would be 10.7 MHz, the poster's would be 10.8, and the actual signal is 884.940 MHz (they're both off by 2.5 kHz due to incorrect step size).

You guys that have to listen to the dreaded GE 800 MHz trunk system must have this board.

It is a WINNER big time.

It silences the tones after every transmit,also the buzz saw noise every 4-5 seconds ,the MDT noise all this mess it silences.

Now it does not silence GE Voice Guard(scrambling).

I expect full production and we as a dealer of the board will start installs in the next few weeks.

Those that can make it to DAYTON HAMFEST in a couple weeks look me up next to the large YAESU booth.

I don't know for sure if we can hear the Miami county system in HARA arena but we will try.
I plan on having a DEMO ONLY sample in a BC230.

Any questions i will try to answer via e-mail only,as of now pricing will be at 100.00 or under.

I recently saw someone was advertising a Pro-50 for sale which had been modified to speed up both the search and scan speeds. Wouldn't you know it, my server vanished the article the next day so I was never able to ask how to get a hold of the mods.

I've looked around, but can't come up with anything for this low-end scanner. Anyone have the actual mod info or a suggestion where else to look?

Cheers, Dave

It really works well for me. Walk through a swap meet with and earphone and you'll be amazed at
how easily your pick up conversations. However, if someone is working a repeater, you only get
the input and one side of the conversation.

I believe version 3.1 is the current model. If you can afford it and want to wait a couple of
months, check out the new Xplorer (see Pop Comm ad).

The Opto CX12AR works quite nicely with the AR8000. I'm certain other interfaces work, but I have
this one and it's good. Be certain you get the "stero" cables with it. Mono cables only work with
the Opto Scout.

You are most likely hearing images (an artifact of your radio's design),
offset 21.6 or 21.4 MHz above the real signal. Check 460.325 and 460.450 MHz
(which are within the normal Police allocation) for the actual transmissions.
See the section "6. Strange Sounds" in your Police Call for an explanation.

Source record: 234730

VUBS79A@prodigy.com (Drew Durigan) asked:
> ... are their exemptions for licensed amateur radio operators?

From the "Listener's Lawbook - 1991 Edition", compiled by Frank Terranella.

Indiana Statutes
s 35-44-3-12. Possession of portable police radios.
(a) A person who knowingly or intentionally possesses a portable police radio commits unlawful use of a police radio, a class B misdemeanor.
(b) This section does not apply to:
....
(6) A person who holds an amateur radio license issued by the federal communications commission;
....

Kentucky Statutes
s 432.570. Possession or use of radio capable of sending or receiving police messages restricted -- Penalty -- Enforcement
(1) It shall be unlawful for any person except .... to have in his or her possession .... any mobile radio set or apparatus capable of either receiving or transmitting .... within the wave length .... allocated by the federal communications commission .... for the purpose of police radios ....

It goes on for a page and a half, specifying everything down to the type of rope to be used at the hanging <g>. I _believe_ that an exception for amateur radio operators was passed 1992, but I don't have a current citation at hand.

A revised edition of the "Listener's Lawbook" is available from Grove. It should be in the glove box of every scanner user who ever leaves his home state. That said, I don't know if I'd want to try explaining the state law to a local deputy at the side of the road (or even to the magistrate the next morning).

: No, actually it's not the input/output frequencies. It is separated by
: 43, yes 43, not 45 Mhz. My scanner covers the same frequencies as his,
: but his is older. If I have a freq on 906.5375, his shows it on
: 863.5375. If I go to 863.5375, I can not pick it up, and he can't pick it
: up on 906.5375. Oh, did I mention that it's separated by 43 Mhz, and not
: 45!

: --
:
-Dave

Well, to partway cover my butt, I did say 'if' it was 45Mhz, but now
you've supplied more details, do you pick up _anything_ in the range
860-870? IF you both select _any_ freq in that range, can he always hear
it and you not? Have you swapped antennas while receiving a freq? Dropped
the squelch completely?

It might help also to know the models of the 2 scanners so someone can
determine what the capabilites, freq ranges and the IF's are.

This is true. Unfortunately, most of them got caught and are now serving time. Also, there was an engineer in Dublin, CA stealing the solar panels. He got caught too, and is also serving time.

There are some wonderful alarms attached to those things.

Yeah, it was an obvious forgery... But gee Hansen, I gotta ask: Why would
anyone want to slander you in such a fashion? What have said or done to
engender such dislike? That's a question that you should be asking when
you look in the mirror, eh?

Yeah, really, what's the point of slamming Radio Shack? We all know that a
piss-poor outfit it really is. The fact is, if you want a scanner, it is
one of the few games in town. As long as people continue to shop there,
the slamming will fall on deaf ears in Fort Worth...

Here in Canada, Clearnet (a large trunking system operator) is currently
building an ESMR network across the country. Its going to be like a third
cellular network (After Bell and Cantel) that will also offer short
messaging and dispatch type radio, in addition to the usually cell type
calls. The system is supposed to be a MIRS system and it is all digital
and cannot be scanned (with noral equipment).

>frequencies?
> I believe the receiver has a 10.7 mHz i.f.

The old PRO-21 has 10.7 and 0.455 MHz IFs. See my column in
the current issue (May 1996) of Monitoring Times magazine for a
compendium of scanner IFs wich covers over 160 models.

The crystals required are usually 3rd overtone type,
but all you need do is visit any company owned Radio Shack
store and order the crystals. Each store has a table of
frequencies commonly stocked at their parts depot.

It took about one week to receive my crystals in the mail.
They were $5 apiece at that time, but I don't know the current price.

Crystals for older Electra/Bearcat scanners with
a 10.8 MHz first IF can be ordered from the same source.

No, not exactly...

The "military air band" runs from 225 to 399.995 MHz. The
frequencies assigned for military aircraft to use at civilian facilities
have no mathematical relationship to the civilian frequencies.

(For example, Rochester, NY tower is on 118.3 and 254.3 MHz.)

Brian,

At least one person (me) appreciates what you were trying to explain to
others about 800 and 900 MHz public safety trunking systems.

Unfortunately, this is not a simple subject and there just isn't enough time or room in this newsgroup to explain the technical and operational requirements of a modern high performance radio system, it has taken YEARS of radio evolution to get to where we are now.

Suffice it to say that PROFESSIONAL communications systems sre no longer simple AM or FM base stations operating on single channels that require the user to select channels and 'tune' in a good signal.

The fact that these systems are operating at 800 or 900 MHz is because that is the only band the FCC authorized that is clear of older systems and with enough channel space to design am efficient trunking system.

I wonder why so many scanner users believe there is some sinister plot or conspiracy behind the use of trunking radios. They blame the FCC, the public safety users, the manufacturers of some grand scheme against them, while the real problem they have is thier own ignorance of how and why trunked radios are used.

Thanks for your galant effort in educating the masses.

Zeus (or whoever..)

Your problem is simply the natural operation of a cheap scanner reciever
under certain conditions.

Regardless of what your scanner salesman tells you, thay all will recieve
channels that you did NOT select. These are called "image" channels and
are mathematically offset from the channel indicated. They may be above
or below the dispayed channel. Most frequently these 'phantom' channels
are actually 10.7 or 21.4 MHz offset from the dispalyed channel. In some
recievers this offset could be as much as 70 MHz, dependent upon the
reciever design.

So, when you are set on a 800 MHz police channel, you may also hear a
nearby cellular repeater on same setting although it is actually
operating on a differnt frequency.

YES........ You are paranoid! Public safety system operators have much
more important things to worry about than an occasional scanner user.

Good monitoring.

2695. Steam Train Excursions.

Newsgroup: rec.radio.scanner
Date: 1996-05-04 00:00:00 UTC
From: bd703@scn.org
Message-ID: <DqwnFu.Foy@scn.org>
Source record: 234505

Just in case some of you out there are railfans......

There are some steam excursions scheduled in the next 2 weeks between
Portland, Seattle, and Vancouver BC.

On May 4, SP#4449 leaves Portland at 9:15am and arrives Seattle at 2:45pm.
(arrived around 3- 3:30pm)
On May 5, SP#4449 leaves Seattle at7:45am and arrives Vancouver at 1:45pm.

On May 8, SP#4449 and Royal Hudson #2860 leave Vancouver at 9:00 am and
arrive Seattle at 3:00 pm.
On May 9 SP#4449 and Royal Hudson #2860 leave Seattle at 9:am and arrive
Portland at 2:24 pm.

On May 13, #2860 departs Portland at 9:15 am and arrives Seattle at 2:24 pm.
On May 14, #2860 departs Seattle at 7:45 am and arrives Vancouver at 1:45 pm.

These excursions are part of the 100 year anniversary of Portland's Union
Station. There is a railfair there May 10-12.

Now for the radio freqs:

BNSF between Portland and Centralia 161.100 mhz "Centralia South Dispatcher"
BNSF between Centralia and Tukwilla 161.415 mhz "Centralia North Dispatcher"
BNSF between Tukwilla and Interbay 161.160 mhz "Seattle Terminal Dispatcher"
BNSF between Interbay and Everett 161.100 mhz "Seattle East Dispatcher"
BNSF between Everett and Blaine 161.250 mhz "Seattle Branch Dispatcher"?

There are phone patches on the following freqs.
160.260 mhz, 160.620 mhz, 160.665 mhz, and 161.130 mhz.

More info can be found at the Friends of 4449 Home Page.

Yes they have! I bought one that the Frequency Fan Club had made
and is now marketing for $33 plus $3 S&H.

It works great. I haven't run the alkalines down, yet, but they
say in their catalog you will get from 30 to 40 hours of run time.

Dial 1-800-RACE-FAN or 1-800-SCANNER.

calloway@gnn.com wrote:

: Guy Teague wrote to Mr. News
: >: Who you gonna go after next...pager notification networks? They hear
: >: things on the scanner...beep you...and collect a monthly fee.
: >
: >What the hell is a 'pager notification network'? Is that something some
: >yahoo's dreamed up out there in La-La land? You guys so lazy you don't
: >listen to your pagers and someone listens for you? Non mi capisco.

: A 'pager notification network' is a network where a whole lot of people who
: enjoy listening to scanners will call in and leave a voice mail at a central
: number. Dispatchers (or some other word to mean the same) get paged when a
: voice mail comes in. They listen, and determine if the 'incident' is worthy,
: and send it out over the digital paging network.

: These networks are great if you're interested in what's going on, but you
: have to be away from the scanner.

IS Mr. Calloway some kind of flamming idiot. There are over 25 pager
notification networks throughout the US and Canada with over 8,000
subscribers. These networks provide breaking stories to news media
organizations throughout the nation BEFORE AP/UPI and Ruiters even know
about it. If this person is called "MR. Media" he needs to study-up on
his subject. I AM with the news media and also run one of those pager
notification networks. GET A LIFE!

Clarification. We have a number of cellular products. One does, in
fact, cost $35,000; most don't. We at one time sold to scanner
enthusiasts. Unfortunately a few flakes spoiled it for the many
legitimate hobbyists.

GRE Superconverter II Get 800-912 Mhz on any scanner!
Scanner World, USA, (518)436-9606 still sells the GRE Super Converter II for $86.99 + $6 S&H. Its a small (about 2" X 2" X 3") box with BNC connectors so that it fits between your scanner and it's antenna. Uses a 9v transistor battery. I just got cellular restored on my scanner and I don't need this anymore! Like new! $59.00 + Shipping

> Thanks in advance for your responses

The chances of findingt ANY accurate Formula 1 freq's are slim.

The teams and drivers are so secretive in F1 that they usually keep
EVERYTHING secretive.

Your only chance would be to happen across a frequency with a
frequency counter, or something. Even then, the transmissions would
probably be encrypted.

It is by far the worst auto racing league to find any info about.

Hello,

It's a source of some satisfaction that the same thing happens in the
U.S. - I'd previously thought that it was just us Brits that had to
endure the questions. Tandy, as R.S. is known over here, seem to follow a
universal policy of building a data-base which I believe they 'sell on' to
outsiders - hence all the 'junk' mail which floats around.

Cheers,

Ron,

Better not go on any further. Your spelling is atrocious. Do you mean
"florins" and "Lira" ?

Cheers,

> approval).

I would have to agree with Richard (Arghh!) and say that IMO the
MVT-7100 is the better "receiver" than the AR8000. Difference is
marginal but on a black/white divide the '7100 wins. Audio is better to
me also. The AR8000 does though have ll the bells and whilstles, which,
if you can really make use are well worth it.

The MVT-7100 is appearing with "CE" approval so should start to "appear"
once more - as to whether the revised model has any changes in
performance (good/bad) we will have to see.

> The MVT7200 is a Japanese home market model only. It has gaps in its
> coverage and will never be CE approved for European sale.

Eh ?

Certainly the MVT-7200 is still available in Japan however as nobody
seems to have put this forward for CE approval it is no longer available
for sale in the UK (& EC) unless you find a dealer who has stock
imported prior to Jan 1 1996. This is why initially the MVT-7200 was
advertised by some as a "limited edition" - it ws unlikley it was going
to be brought into Europe after Jan 1st.

With reference to coverage both the MVT-7100 & MVT-7200 if purchased IN
Japan have gaps in their coverage - it is certainly not something unique to
the MVT-7200. They have some of the Japanese Phone frequencies deleted
however they are simple to convert to full coverage and all "Export"
versions are full coverage.

The only difference between the Japanese "home market" version of the MVT-7100 and the "export" version is one single surface mount component which if in place blocks out certain frequencies. The same applies to the MVT-7200.

I would say the MVT-7200 is the better of all three radios. In comparrison to the MVT-7100 performance on the HF bands is better, SSB is sharper and the Narrow AM mode hels when using it for AM Broadcast listening. The internal ferite bar antenna works...but thats all. The backlighting can turned on permanently andwhich is a good move. One downside is that audio is not as crisp and I prefer the MVT-7100 sound.

At the end of the day they are all good sets !

>Also, does anyone know of a freeware computer program that lets you
>input a frequency and it tells you which switches to flip?

Here is one I wrote to do just this very thing. The original logic is almost 18 years old. It runs on Apple II's and PC/XT's as well as any other system that will take the Basic text and compile or interpret it in to an executable program.

By the way, you can change the frequency limits for F in the program, but you are just wasting your time. The BC101 won't get the portion of 2 meters below 146 MHZ and it won't get 6 Meters.

Martin McCormick WB5AGZ Stillwater, OK 36.7N97.4W

Subj: Anarchy in the Newsgroups

Yo! Kurt:

Friday April 26 1996 16:00, Kurt Shedd wrote to Bill Cheek:

KS> On a side note, I have found it interesting once again on the
KS> scanning newsgroups to see the people from here who have left use
KS> certain phrases and words to describe the very scanradio they wanted
KS> to be in (Not to mention the flattering words they have to say about
KS> BC). Most of what is said I let go over my head, but must admit that
KS> once in a while you let yourself get drug down to the 1" cranium
KS> thickness level, and say things that could have been left alone, but
KS> then again, I must admit that I am not the one being denegrated, so I
KS> might respond in similar fashion, just a little more toned down.
KS> (maybe that comes from being over-educated.) Kurt...

Those are the people who wanted to turn this echo into a FLAME forum, too.
They were proscribed from doing it, so they went to the anarchy of the
newsgroups.

You're right, once in a while when I have a minute, I hop onto
rec.radio.scanner and hose them down a little. Who cares? What
difference
does it make? They don't want to play by the rules - why should I?
Sooner
or later, the NewsGroups should learn that I wills spend minimal time there
until the slimeballs are dealt with up front.

Those forums are supposed to be topical and technical like this one...and
that's the sole reason I participate in the first place. I am interested
in
scanners, scanning, and technology. THAT is what I want to deal with. In
a
word, I can control that on this echo, and will do so.

I can't control it on the newsgroups and therefore do not participate there
to any appreciable extent. The denizens of the newsgroups should wake up
and exert some influence on those characters.....but they never will.

Thus, this echo will prove to be a refreshing oasis to people like me who
are more interested in high technology and using radio.

Actually, what you have is probably accurate. The OSP hasn't made any significant frequency changes that I know of in the past 20 years, probably longer. They are, however, in the process of setting up a state-wide 800 trunked system. I don't have any details about that. Check the Police Call frequency directory for current frequencies.

You'd think some of these "agencies" would have had a clue before hand. Here in the Bay Area (northern California) go ahead a clone a roadside call box phone! The only calls you will be able to make will be to the highway patrol. You see the carriers set those phones up in the network to only call one preprogrammed number. If the system sees that ESN come up to make a call, it will only go through to the CHP.

Your probably hearing images of 459.800 and 459.850. These frequencies
are in the "Air-ground Radiotelephone Service". The 454/459 channel pairs
are normally used to provide phone service to general aviation aircraft.

Some people really like to carry this to the extreme. They just like
being difficult, I guess. Orchard Supply Hardware (CA) has recently
started asking for zip codes. I know exactly what they are doing with it
- they're making graphs to show eachother at meetings - so what. I hardly
consider my zip code to be personal information.

How personal can it be? I have the same zip code as about 35,000 other
people in this city.

Not too much new, except for their "Talk" frequency. That's 44.90, used a LOT by their drug teams as well as other troops. They've had that allocation for quite some time, but wasn't put to use until mid-1995. The 800 MHz system is still in the talking stage, expected to be on-line in 2002-2005. The Cleveland area does use the 44.94/45.26 pair for the freeway patrol.

Does anyone have crystals for the old PRO-21 scanner? It's a four-channel unit that covers 144-174mHz, and 450-512mHz. Does anyone know what the crystal fundamental needs to be for reception of specific frequencies? I believe the receiver has a 10.7 mHz i.f.

On the bottom of the unit (on the same board where the infamous J1 is
or was) is a multi-wire connector labeled J4. If you cout or
otherwise open the connection at pin 5, you will prevent the beep from
reaching the amplifier (or at least slow it down!).

You could also try lifting C-173 or R152 to open the "beep" path too.
These would be on the main board near the audio amp, IC9.

2748. Heathkit GR740 : Help need info/manual

Newsgroup: rec.radio.scanner
Date: 1996-05-05 00:00:00 UTC
From: saylorr@flash.net
Message-ID: <4mgs6s$lcj@excelsior.flash.net>
Source record: 234518
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I have inherited a Heathkit GR 740 scanner. It came with no manuals or instructions, and I would appreciate any guidance I can get concerning it.

I have figured out how to add specific freq. for it to scan, but there are several elements which I don't understand.
1) There is a switch at the bottom of the panel labeled position A <switch> B. As near as I can tell so far, it doesnt appear to affect anything. Can anyone tell me what this switch does?
2) There are two red buttons labeled 10 and 20 respectively. They both turn an LED on when pressed, but once again I don't know what they really are doing.
3) The lockout, priority, and delay button don't appear to work, but I just don't know how they are supposed to work.

Any help e-mailed to me would be tremendously appreciated.

The Heath GR470 is really an Electra/Bearcat BC20/20.
The PC boards came preassembled.

>1) There is a switch at the bottom of the panel labeled position A
><switch> B. As near as I can tell so far, it doesnt appear to affect
>anything. Can anyone tell me what this switch does?

Chooses between two sets of 20 channels. You have to press
manual or scan after changing the A/B switch to see any
change.

>2) There are two red buttons labeled 10 and 20 respectively. They both
>turn an LED on when pressed, but once again I don't know what they
>really are doing.

Enable the first and second bank of 10 channels each.

>3) The lockout, priority, and delay button don't appear to work, but I
>just don't know how they are supposed to work.

These are very basic functions found on almost all scanners.
Lockout removes the channel from the scan list so it won't be
scanned. Delay associates a 2 second rescan delay to the
channel so the scanner will pause for 2 seconds before resuming
its scan after pausing on the channel.

Priority samples channel #1 every 2 seconds on this model.

From the FAQ "Buying a Used Scanner:"

BC220 (Electra): 1979 vintage. 20 channels. Reasonable
number of features but 20 channels doesn't seem enough.
Service Search for Marine and Aircraft. LED readout. Good
scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with
40 channels and different CPU circuitry. A maximum of 20
channels can be scanned at one time. Reasonable number of
features. Service Search for Marine and Aircraft. LED
readout. Good scanner, but tinny audio.

The idiotic thing is that the FCC allows the airlines to decide whether to allow scanner use in flight when they know full well that it will not affect the aircraft's communication or navigation systems. Of course some of the more hypocritical airlines are not above collecting $5 per minute to let you make an in-flight phone call with a radio transmitter when they wont let you use a radio receiver.

The Uniden BC-7 receives CB. I keep cahnnel 19 programmed in when I am on the highway. That way I can get traffic info while scanning. If I need to transmit, I use the CB. But with the scanner, it tends to filter out most of the hash, thus better than leaving the CB turned up.

Yes and No. POCSAG is a protocol, not an encryption method. There
is a difference.

But the ECPA does prohibit the reception and 'decoding' of the signal;
not because of an encryption issue, but just for the simple fact that
the signal is used for paging... (Thanks, Congress)

I think that's Teletrac, not LoJack. Teletrac only turns on the 173Mhz signal after you report your car stolen, it is activated sort of like a pager. Cops with RDF's drive around looking for the only signal on that frequency.

I believe LoJack uses a type of spread-spectrum signal.

I have the Winter '95 version.
Pro: seems to be fairly accurate, especially given the subject (how
fast things change, especially). For the amount of data, the cost is low.
Con: the Windows search engine (a FOXPRO derivitive) is s l o w. The DOS
engine is much faster.

Common Wireless Bugs (Low Power - Well under 35-50 mw)

44.500 - 51.000 mhz "Baby/Room" monitors
72.100 - 75.400 mhz Hearing Assistance systems
54.000 - 150.000 mhz "Kit" Bugs

98.000 - 108.000 mhz Cheap out-of-band FM Bugs
112.000 - 142.000 mhz Cheap out-of-band FM Bugs
140.000 - 160.000 mhz Cheap out-of-band FM Bugs

60.000 - 320.000 mhz Low Cost kit bugs
398.000 - 406.000 mhz DECO Bugs (398.600/605, 399.450/455,
399.025/030, 406mhz)
25.000 - 450.000 mhz European/English Kit Bugs

150.000 - 216.000 mhz Typical VHF "Body Wire" & Pro-Grade Bugs
109.000 - 140.000 mhz Digital VHF Pro-Grade Bugs
138.000 - 174.000 mhz Typical "Spy Shop" & LE Cheap VHF Bugs
(155-172
Popular)
140.000 - 150.000 mhz Popular Xandi Flea power kits (143/144mhz)
150.000 - 170.000 mhz Popular Japanese Flea power kits (under
5mw)

150.000 - 220.000 mhz Commercial Wireless Microphones
169.000 - 172.000 mhz 47 CFR 90.265 Authorization *** VERY
Popular **
174.000 - 216.000 mhz 47 CFR 2.106 (NG115) Authorization
395.000 - 410.000 mhz German UHF Wireless Microphones (PK
Electronics
219.000 - 530.000 mhz English UHF Wireless Microphones (300-500
popular)
470.000 - 608.000 mhz Commercial Wireless Microphones
730.000 - 806.000 mhz Commercial Wireless Microphones

889.000 - 960.000 mhz Modified Cordless Phones (S/S & Hoppers)

380.000 - 480.000 mhz Video Bugs - US
890.000 - 960.000 mhz Video Bugs - US (902-928 Hot)
905.000 - 928.000 mhz Video/Audio Consumer Products (i.e.:
Recoton)

1.700 - 1.930 ghz Video Bugs - US
2.400 - 2.500 ghz Video Bugs - US *** VERY Popular
***
5.725 - 5.850 ghz Video Bugs - US *** VERY Popular

This was posted by jmatk@tscm.com (James M. Atkinson) back
in March.

Update on Microwave Bugging Devices - 3/28/96

0.902 - 0.928 ghz - Popular Commercial FH/DS Devices
1.710 - 1.755 ghz - DEA Audio/Video Bugs (over 1400 bugs purchased in
1995)
1.710 - 1.755 ghz - DOJ Audio/Video Bugs (.25 to .50 watts)
1.710 - 1.850 ghz - Treasury Video Surveillance Systems
2.400 - 2.484 ghz - Popular Commercial FH/DS Devices
4.635 - 4.660 ghz - Treasury Video Surveillance Systems

Most recently purchased gvt microwave surveillance gear seems to be
running between 900mhz to 5ghz, with a few systems operating on the 7/8
ghz bands.

Also, keep in mind that the pros love to use ultra low power devices which
use the power lines as the transmission medium/antenna (9khz to 300 mhz).
Devices typically operate below 10mw, often below 1mw. The devices
typically use Wide FM and use voice inversion encryption... VERY easy to
demodulate.

Note: According to a recently obtained DOJ surveillance training manual:

The typical range for the 28 ghz devices is six miles, the typical range
of the 2.4 ghz is thirty miles, and the typical range for the 1.7ghz is
44 miles.

... frequency modulated applications should operate below 3 ghz to take
advantage of the favorable frequency propagation characteristics of that
part of the spectrum.

...Frequency Hopping and Direct Sequence Devices spead spectrum devices
should operate above 1.5 ghz, this will prevent the emissions from being
detected by electronic countermeasures.

>Can anyone confirm or deny?

The 800 mhz freqs are listed in the latest Police Call under Eastside Public Safety. It appears that all of the police and fire depts in King Co. are going to 800 mhz. The eastside (Bellevue, Redmond) and Seattle are using their new systems now. I heard a rumor that Valleycom will be turning on their system soon. King Co. is supposedly going 800 mhz in a few months.

: There are actually two legal impediments to monitoring cell calls here
: in the US.
: The ECPA , makes it illegal to actualy listen to such calls (also cordless
: phone calls).
: The TDDRA made it illegal to import into the US, or to manufacture in the
: US, any scanners that could operate on (tune to) the cell frequencies after
: April, 1994.
: The TDDRA rules have some strange parts; any modifications to enable tuning
: to the cell frequencies must be "not easily" done, with a short list of things
: that are specifically forbidden. Also, the Customs department seems to be
: interpreting this to mean, imported for merchandising purposes, as individual
: scanners, whether coming in by frieght or luggage, do not appear to be targeted
: for any action.

Why do I want cellular?

I have a PRO-2006 which is circumcised. While I do not listen to cellular calls per-se, I made this mod because in our region, (the High Desert area of California - Nevada), there are some frequencies that lay in the cellular frequency assignment that are used like the business band (151.xxx) I know that there are some out there who will poo-poo this proposition, however, I have heard them with my own ear, so don't say 'it ain't so'. I am speaking of the area of Northern Death Valley and Beatty Nevada. I have heard these conversations as far South of Beatty as the turn off to Pahrump. They are definitely NOT cellular conversations. Remember, the 800 MHz band is also quite close to cellular, and the San Bernadino county folks use these untrunked freqs. I am also reminded of the harvesters that work through the middle West during harvest time. They use Marine radios and frequencies. Why? Because the radios are cheaper, readily available and they are so far inland, they don't interfere with any shipping! And I guess the FCC doesn't care that much.

My comments on cellular conversations? Booooooorrrrriiinnngg...!!!! I'd much rather watch the grass grow.

> top unit....

Jim:

You cannot modify any of the current Radio Shack scanner radios to directly receive cellular communications. Some of them have the ability to receive image frequencies of cellular, but with greatly reduced sensitivity. The exception might be the top end base units that can accept the addition of the Optolectronics computer controled add-on, but that's another $300.00!

The "best" Radio Shack scanner that "could" be modified for cellular was the PRO-2006. You can still find them on the net, used for around $300.00.

You completely blew the attribution of the quote, but you're in the
media, that should be a common occurrence! <g> I hope Mr. News suitably
chastises you!

It saddens me that what used to be a nice, casual hobby will shortly be
ruined by you barracudas and paparazzi who sell what they hear. Eventually
all those you victimize by making commercial use of their radio

conversations will find a way to encrypt their signals, leaving those of us hobbyists left to listen to taxicabs and laundry trucks.

BTW, I'm still waiting to be proved wrong about the media having an exemption to the law that says you can't 'scan for profit'. Mr. News has proved he's too lazy to do the research, maybe you will. How does a 'scanner notification service' claim the exemption to the law?

> Has any one used the Frequency Database CDROM called Spectrum? Let me
> know any pros or cons. Email me at cyberbo@mainelink.net

I bought it about two-three months ago. It costs about $30, which is not bad, given the alternative of having to come up with all of the data on your own and then having to move it into a scanner program manually.

The interface is dated and the database engine is not all that sophisticated. It does not give you, in my opinion, enough options for slicing and dicing the data. For example, if you want to find all of the state police freqs in a particular state, you must search county by county, rather than the entire state at one shot. That wouldn't be so bad, except the program is s-l-o-w and it is time consuming to do searches of any kind. If you have a very large hard drive, you can transfer the data and run it from there, which speeds up things considerably. You can also dump it all into another database and greatly expand on your search abilities.

I noted my relative dissatisfaction with the product in this forum a while back. I said something to the effect that the program did not give you adequate search abilities and that the interface was cheesy. The next day, I received a telephone call from a fellow at Percon who told me that negative comments were bad for business (he said he loses 20-30 sales each time). He basically told me to shut up and return the product for a refund. I chose to keep it, however.

In Canada, we have the right to listen to almost anything that can be
received. However, the Radiocommunications Act, has a section regarding
the 'Secrecy of Communications.' Essentially, what it says is, that
while you can listen to anything you want, you must not reveal the
contents, *or even the existance* of any transmission you hear.

It would appear that, in Canada at least, these 'pager notification
networks' are breaking the law. Penalties are up to $5000 fine and
one year in prison, although I don't believe anyone has ever been
convicted, or even charged.

Is there some similar act or section in US law?

Regards

KH

CB radios are AM, cordless phones are FM. Besides, a CB radio only picks
up signals on a narrow band near 27Mhz, far from where cordless phones
operate.

ACARS is the system for monitoring airplaines
each airplane have his own i.d. .

beacause they fly so high you can follow them from a
big distance .
you need a modem like a baycom type to decode these signals send in the
air-band .

this is the info i got here for the moment

You probably should be asking uniden. Before you send it in,
ask their service department what they'll do, make sure
that you explain in your cover letter that you do not want
the boards swapped out or have any unrelated modifications undone,

The only thing you may have to worry aboiut is that they
could decide that it's cheaper to swap out the guts of your
radio then adjust it. If they decide to do that, it'll come
back unmodded.

But if your question is about any legal requirement for them
to undo the mods, there isn't.

2795. any mods for the pro-37 besides cellular?

Just guessing, but from other scanners that I know of, it probably senses
that the frequency is receiving digital data, and skips to the next
channel.
This is usefull when listening to, for example, trunked systems. Since
the control freq. changes every day, you would normally have to change the
control freq every day.
With data skip, you put all the freqs in and let the scanner worry sbout
skipping the control channel.
cheers

I bought the PRO-62 and was disappointed in its performance. It did not work as well as my old PRO-38: it was less sensitive and also picked up a strange signal on a favorite frequency that the old scanner did not. I have returned it.

Can't comment on modifying the units.

>

AFAIK this is true, but not because of the FCC-mandated federal examption, but rather because the states themselves have, in each case, amended their laws in this manner.

> I believe we can thanks the ARRL for their help in this exemption.

The ARRL and FCC have notified everyone that, even in the presence of state laws forbidding such devices, **ham radio transcievers** are legal for licensed hams to have and use, in all states. This, however, does not apply to receive--only devices such as scanners. Scanners are legal for licensed hams to have in one's car in all (I think) states, but it is because the laws themselves have been changed at the state level. I believe that KY amended their law in this way last year; rumor at the time was that KY was the last state to still have an anti-scanner law on the books that applied to licensed hams.

If you want to get an earfull...take your scanner to a college football game. A good many teams use UHF freq. to communicate with the coaches in the press box and the head coach on the field. Be sure and use your earphones so everyone around you will not hear what's getting ready to happen.

>
> What does it actually do ??
> =====
Often, you will want to both record *and* listen to what your
scanner is receiving. To do this, many receivrs have a "tape
out" jack. This jack's output level is fixed (not controlled
by the volume control). Often, this jack's output level is too
high for the input of a tape recorder, and results in a distorted
recording.
An attenuating cable will reduse the signal level from the tape
out jack, to a level that the recorder can handle.

2822. Re: AR8000/ScanStar files

Newsgroup: rec.radio.scanner
Date: 1996-05-06 00:00:00 UTC
From: atocco8586@aol.com
Message-ID: <4mm043$4c1@newsbf02.news.aol.com>
Source record: 234396

YES!!!

I JUST GOT MY AR 8000, AND I AM USING THE DEMO VERSION OF
SCANSTAR WITH MY OS456/2006.I KNOW THIS IS NOT EXACTLY WHAT YOU ASKED
ABOUT, BUT I'LL GET TO THAT. I HAVE SOME QUESTIONS ABOUT SCANSTAR.
HOW DOES ONE ACCESS THE HIT LIST, WITH DTMF AND OTHER TONE INFO? DOES
SCANSTAR HAVE A FEATURE I HAVE HEARD REFFERED TO AS CTC (CONSTANT TONE
CHECK). WHAT I AM LOOKING FOR IN THIS FEATURE CAN BEST BE EXPLAINED BY
ASKING THE FOLLOWING QUESTION; IN ORDER TO DETECT ANY PL OR DL SQUELCH
TONES, DO YOU HAVE TO CATCH THE TRANSMISSION FROM ITS INCEPTION (THE
MOMENT THE PERSON "KEYS UP), OR CAN THE TONE BE DETECTED IF YOUR SCANNER
CATCHES THE TRANSMISSION IN THE MIDDLE OF A SENTANCE, OR TRANSMISSION.

SOMETIMES WHILE LISTENING TO --MY-- CORDLESS
PHONES VARYING TONES ARE DISPLAYED DURING THE SAME CONVERSATION WHY?,
NORMAL?

SOMETIMES I SEE ALPHA INFROMATION (LETTERS) DISPLAYED IN THE AREA MARKED
DTMF, WHY? NORMAL?

SOMETIMES I SEE A TONE DISPLAYED AS D423 WHEN RESCUE UNITS ARE
TALKING. SOMTIMES RESCUE UNITS TALK, AND NO TONE IS DISPLAYED--DOES THIS
RELATE TO THE CTC FUNCTION MENTIONED ABOVE?----------AS WELL AS BEING
PER CON, AND GROVE COMPATIABLE CAN SCANSTAR IMPROT DATA FROM THE CD ROM
CALLED SPECTRUM

BACK TO YOUR ORIGIONAL QUESTION I AM VERY INTERESTED IN TRADING
FREQ' DISK FILES FOR DIFFERENT THINGS .THINGS LIKE, GEOGRAPHICAL AREA,
AGENCY, AREA SPECIFIC MICKY'D FREQ'S, BODY WIRES. I FOR SURE WANT INFO ON
FEDERAL FREQ'S AND VERY SPECIFIC INFO ON WHICH FREQ'S ARE MOST ACTIVE FOR
THE DIFFERENT AREAS THAT FEDERAL AGENCIES DO WHATEVER IT IS THEY ARE
DOING.

DONT HAVE MY COMPUTER INTERFACE FOR THE AR8000 YET,

BUT ITS ACOMMMIN SOON AND I WILL BE PUTTING SOME

KILLER INFO. TOGETHER ON THE DIFFERENT AGENCIES THAT ARE

ACTIVE IN THE TAMPA BAY AREA.

I COULD GO ON FOREVER. PLEASE REPLY.

>
> Good monitoring.

You are right about this. I worked for the Dept. of Public Safety for 2years and they were in the process of switching over to 800MHz only due to the fact that it's cleaner and has somewhat better range. The radios were (and I think still are, never converted over yet) at the 400mhz area and bleed over from other agencies is terrible. The idea that they dont want scanners to hear it is not valid. They have plenty of options like DVP (motorolas Digital Voice Protection) or SECURENET another Motorola technique that would make transmissions much safer than using blocked freqs. In fact some of the SOTs (special operations teams) in the area use unregistered freqs and are scrambled in some way (not to sure what they use) which makes them even safer!

Just my view... Had to jump in...

I have had great results with Spectrum disks. I use FoxPro to extract
data to my specifications, then import the retrieved data to FileMaker.
The included search engine, while it may be limited, is adequate for most
requests and users. More experienced users will have a program that can
use ".dbf" files (which is the format used by Spectrum) and design there
own searches.

The data alone is worth the cost, and then some.

The regional disks have all the info on the license, and is great if you
need more info on the record.

Well--
I was there. There were a few isolated outages for a short period, and some delayed dial tones (People calling each other to ask "What was that?!". I turned on my monitor--it was actually relatively quiet.

I'm really glad hams are available to help. They perform extremely valuable services during emergencies. This one was more in the nature of one hell of a wake-up call rather than a catastrophe (except for a small number of folks who did have serious damage).

I thought the account was a bit overblown under the circumstances.

Just my $.02

:
: Aha. Many "ram-raiders" (no longer happens, really) over here used
: scanners as routine, apparently. So, if you've got all these data
: channels over there, then there really can't be /that/ much to listen
: to, unlike I previously thought. I suppose all the info is encrypted
: before being sent? Otherwise I would have expected to see more messages
: about software/hardware to read the info.

The data is sent using, usually, Motorola's ultra secret methods. Even the comm. techs. for the police don't know it.
Around here, the system doesn't work right half the time (messages don't get through, or very common, scroll off the screen). The dispatch (unless it's like kinda "cofidental", like full names of suspects) is on radio. Quicker, and the cops can listen while driving, listen on their portables, and every cop hears each call (incase of backup).
As well, I think the patrol cars have GPS gear in them, though, I have no idea how it is used. Dispatch never seems to know where the cars are (they have to ask).

And actually, the other day, I was listening and heard an officer say he'd be out at <address> attempting to serve a summons. After a few seconds it sunk in that it was my friend's address. (He had 5 tickets over the weekend)

Matt

I second the motion. HAMS have always performed valuable services
during emergencies.

One the most key elements of recovery from almost any disaster is
communications. The HAMs perform a service like that of small
independent businesses and agencies do in our market driven economy when
the big government agencies fall flat on their behinds.

My $.02

2834. Freq. for the new highaway alert system?

Newsgroup: rec.radio.scanner
Date: 1996-05-06 00:00:00 UTC
From: delaney@j51.com
Message-ID: <4mlq8p$p0l@tzlink.j51.com>
Source record: 234408

What frequency does the new highway alert system use. It's the one where ambulences and such would have a transmitter in them that makes you radar detector or something in your car beep. I think the Uniden 360 has it (called Saftey Alert?)
I wanna punch the freq. into my scanner.

Matthew:

Good question! I know here in Michigan, at one time, the law only applied to scanners that were bolted down, and wired in. Handhelds were exempt. This is no longer the case. ALL scanner radios are illegal to have in your car, unless you have a HAM license, or obtain a special (impossible to get) permit from the police department.

Ralph:

If your primary interest is in one direction, buy the Grove Scanner Beam,
and hang it on your wall! Make sure it's a wall that allows it to point
in the direction of your target signal. Not exactly "hidden" :), but it
will work great!

This message intended for Blake Bowers;

Hey Blake...I never heard back from you re: my reply to your
somewhat lagging (and lacking) More Cheek Antics message.
Wussup ? Did you get a copy of one of my articles yet ?
Would you like one ? Did you have a list of techncial accomplishments
of your own that you'd like to share with us ?
I'd just like to know whats with YOU, Bill Funk, G Hansen and the other
Cheek croonies who run to his side whenever someone stands up to his
BS !?!? Its not about trying to simmer the BS...its about always siding
with ol' Billy boy.

I hear that over on FIDO he (Billy boy) is slamming us Internet
users...What was it now...something to the effect of "...I pop over to
the internet occasionally to keep them inline..." he says ! Hahaha !!!
Like HE'S the king of all radio ! A legend in his own mind !
"I'll learn 'em !" :)

I also hear that there is still great controversy over the commercialism
and his bending the rules to suit. He is such a manipulative soul that
he attempts to create a barrage of smoke so that when the dust settles
hopefully nobody will notice that the echo has changed from a totally
non-commercial area to whatever Billy boy needs it to be to flog his
wares. ie... his new brainstorm...a compilataion book with regurgitated
mods from the previous 3. Nothing new to print...I know...we'll
repackage the goods and market it for the technically challenged.
Fido Scanradio was and always will be the "Bill Cheek scanner mods book
support echo".

Heard the T-Birds several times this week on 141.85. My brother was coached (by me) to tune in 120.15 on his BC-100XLT to get the image on the AM air band, and it worked great.

Try it on your AM band scanner when the T-Birds are in town.

If you don't have a cool new rig with switchable modes, tune

141.85-2*IF. THe image will come in great on AM if your IF is in the 10.7, 10.8, or 10.85 range.

>
> I believe LoJack uses a type of spread-spectrum signal.

Negative. LoJack uses 173.075 Mhz and is the sole user of this channel.
It was taken away from the FBI(!) in 1989!
LoJack should not be confused with the Location and Monitoring service
at 902-928 Mhz which uses a spread-spectrum signal and locates beacon
equipped cars or objects.

The shareware audio analysis program Cool Edit can do a Fourier
Analysis of any audio source and graphically displays the components.
The results are good enough to determine the frequency pair of the DTMF
signal so that you can identify the coded digit. Not elegant but it
works. The latest version is COOL152.zip at ftp.cdrom.com.

2844. Image frequencies

Newsgroup: rec.radio.scanner
Date: 1996-05-06 00:00:00 UTC
From: jonma@ix.netcom.com
Message-ID: <4ml9nn$t7l@dfw-ixnews9.ix.netcom.com>
Source record: 234418

Thanks to everyone who replied to tell me that my mysterious Seattle-Eastside frequencies were images, that was definitely the case.

This made me curious about image frequencies. Can someone here answer some questions about them?

1. I understand how images are produced by the conversion process that uses IFs, but why then doesn't every broadcast frequency produce an image frequency? Why doesn't each image frequence have a twin on the other side of the broadcast frequency?

2. Why are double-conversion scanners prone to producing images?

3. Why do triple-conversion scanners eliminate images?

4. Are images more common in certain bands than others? Why?

Thanks in advance,

Jonathan

Message-ID: <4mmrd2$90m@folderol.jlw.com>
Source record: 234420

The display on my R7000 started going out at random times about a year ago. Percussive maintenance usually fixed it, but the radio soon built up a tolerance for this technique. Eventually I went in and reheated most of the connections on the flexible conductor ribbon that connects the display to its driver board. Apparently there had been a cold solder joint or two.

As for the PM, the radio _is_ built like a tank, and still working fine.

You cannot cut a cellular antenna to work on UHF.
The cellular antenna is at 860 MHz abiut 1/2 the length that
you need. No matter how much you cut it you cannot make it longer.

Just out of curiousity, is the demand for a PC based DTMF decoder because most people already own a PC and a sound card? I for one wouldn't want to use my pc, too much electricity, too big in size, too long to boot up, etc etc.

: Good question. There are plenty of programs out there that claim to do
: it, but they either don't work whatsoever or they work very poorly. If
: anyone knows of a DTMF decoder program which actually *works* I would
: love to hear about it as well.

Cell phone antennas are in the 12 inch range approximately, yet there are 1/4 wave antennas that are only three inches long that work great (I have one on my car).
I know that the UHF antenna should be approx. 25 inches yet on cop cars they look like they're about six inches. Are these 1/4 wave as well? That's what I was talking about when I said I was going to cut the cellular antenna.

Thanks,
Randy R

scrambling so
: that you hacker types can't intercept my calls. <<

Standard sales tactic. Your phone call can easily be understood by 1. a simple frequency inversion kit or 2. dialing up or down a few frequencies until it is somewhat intelligent. The only real secure system is a digital, spread spectrum telephone. For the items you really want secure, don't use a telephone!!! especially cellular!!!!

I can lock out this channel. If you have it set for a priority channel It will show as locked out but in fact will not. When tuned manually it shows locked out but in scan it is NOT locked out. Removing the priority selection did the trick.

ok, plain and simple: retransmit the audio rec'd by scanner (the scrambled
cordless phone), with a CB(AM). Tune to that 27mhz freq. with the SSB
receiver, slide the VFO up to where the upper sideband is but switch to LSB.
This inverts the audio. Kind of a pain, but it works.

>
> bw
>
>
This depends on several factors:

Does your unit have a 12vdc jack? (or is it 9vdc?)
If you have to use a coverter for the voltage, then your charge time will
depend on the amperage of the converter.

If your scanner can take 12vdc then if you use the cigerette jack
in your car, then they should be fully charged with in 3hrs.
Be careful not to over charge the batteries, and make sure your
batteries can be "quick charged". Also observe the temperature of the
scanner so you don't hurt it. (giving more amps to a unit will cause
exsevive heat so just watch yourself.

What if you were to get one scanner per channel, and leave each scanner
'parked' on one of the frequencies?
Since you wouldn't be 'scanning', you could use broken scanners that
didn't scan.

The GSM cellular format is digital so you would need a codec for that
format to monitor it. A standard scanner would not be enough by itself.

The UHF antennas on the cars may be for the lower 406-430 band and may be slightly longer? Why not just go out an buy a proper UHF whip, like a larsen? Or better still, get a colinear UHF antenna (the ones with the loading coil in the center).

> Definitions?
>
> 1. Spectrum Analyzer
> 2. CTCSS
> 3. POSAG
>

Spectrum Analyzer: A test instrument that allows you to *see* radio waves
rather than hear them. An invaluable tool in the radio manufacturing
and service industry.
It is similar to an oscilloscope with the horizontal sweep syncronized to
a very sensitive wideband receiver...it tunes up the band as the trace
sweeps across the screen. The vertical of the scope is connected to the
output of the receiver such that the stronger the RF signal, the higher
the deflection.
The horizontal is adjustable so that your can sweep wide bandwidths with
low resolution (you'll see the signals as "blips" or lines).
sweeping smaller bandwidths alows you to 'zero in' on a signal and you
can spread it to actually see how wide the signal and its sidebands are.
The vertical is also adjustable to accomdate weak or strong signals.
The analyzer is calibrated so that you can measure the actual frequency
and amplitude using the graduations on the screen. Modern S/A's have
cursors and digitally displayed info on-screen.

CTCSS: Continuous Tone Coded Squelch System
(AKA other trade names such as "PL" by Motorola ect...)
A receiver using CTCSS has a tone decoder inline with its output
connected to the squelch circuit such that it will only unmute the
audio if the specific tone is being received along with the signal.
These tones are usually in the low 100's of Hertz thus are almost
subaudible.
Useful when more than 1 company is using the same frequency...each
companies fleet of radio gear will be equipped with their own tone
encoders on the transmitters and decoders on the receivers.
Your company will not hear my transmissions and visa-vis.
You just have to keep an eye on the "busy" or "frequency in use"
light on the radio so that you do not interfere with other users.

POSAG: (I think it's actually "Pocsag" or something like that.)
I don't recall the what the acronym stands for off hand (Anyone ?)
but it has to do with digital data transmission for pagers.
There have been some shareware programs written and simple op-amp
decoders described here on the net.

Hope this is of some help to you...
Regards...
Hugh Duff VA3TO Toronto

>if you used 12 volts straight from the car battery?

Please be more specific about the make and model scanner in question.
If the scanner is meant to be charged from a 12 VDC supply,
it will require roughly the same amount of time to recharge when
using an auto battery.

A simple battery charger is composed of two stages:

1) a DC voltage source
2) a means for limiting the current

Some early consumer equipment was furnished with a wall wart charger.
A current limiting resistor was built inside the wall
wart housing.

The 12 VDC "wall warts" supplied with modern scanners,
including the Uniden BC200XLT and BC3000XLT are not chargers. They are
12 VDC (nominal) power supplies. The current limiting circuitry
is built inside the scanner or NiCd pack and determines the
charge rate.

With respect to charging, the BC200XLT scanner doesn't know nor care
whether the 12 VDC is furnished by the supplied wall wart,
an automobile electrical system, a solar panel, etc.
so long as the voltage source is somewhat stable while furnishing the
required current.

Many of the GRE-made Radio Shack portables (e.g., PRO-39, PRO-43),
employ a simple series resistor mounted inside the scanner case to
limit charge rate. The RS wall wart is a 9 VDC power supply.

Source record: 234466

There is continuing news coverage of the Kansas City MO municipal 800 mhz trunked system problems. The Police were to have switched over the new Ericsson system two years ago but still haven't done so. I believe the north zone may be on the system, along with the Fire Dept.

It's an 18 million dollar package that so far has generated nothing but negative news. The PD is reluctant to make the switch from their current 154/155 mhz system citing reception problems in buildings, delays in getting access to a channel, problems with handheld to handheld communications. There was an issue of encryption last year and that was resolved by the PD agreeing that most traffic would not be encyrpted, only special units or special operations. So if you're comin' to KC and want to hear the standard "suspicious party with gun", and "disburbance" calls, keep the 155.85 and 154.74 mhz freqs programmed for a while longer.

That's because they are set to reflect FCC allocations, not Industry
Canada. Here, the bands are followed pretty closely so when you press
POL you are likely to actually get police traffic ... The only ones that
would work on my BC300, were I to take it to Canada, would be Marine,
Air, and maybe Telephone.

Bill;

Hey thanks for the response...that was quick.

Yeah, I used to have a Pro 2006. I liked the capabilities of the unit
but absolutely hated having to program it. Truly a wierd, cumbersome
unit. I imagine that's how Opto sells so many of their mods for it.

Adding cellular would be nice, but that's not what I meant: the cheaper
RS units like the Pro -2034, -2039, -2040 and -2037 all have gaps in
their receiving ranges, slower scanning speeds, and the like. I'm just
wondering if you could spend, say, $250 on a Pro-2040 and with a few
(free or low-cost) mods, up it's scanning speed, # of channels and close in
some of the non-cellular gaps in it's scanning range. Then you'd have
something that performs a little more like the high priced Pro-2042.

I realize that anything cheaper than the -2037 is still going to be a
double-conversion unit rather than a triple, but I'm not sure that I'm
so serious about scanning that this is a problem.

Thanks;
JKB

-> .
Actually, The SS freqs. will not go totally silent. You will hear
their encrypted transmissions; it will simply sound like static.
Your best bet to follow the action will be to listen to the regular police
freqs. of the towns the Prez visits since it is doubtful any of these will
be coded. Especially try the police aux. channels, ch.2, ch.3, etc. if they
have them instead of the normal dispatch channel. Here is where you will find
out whats going on as the PD will be involved. Also check your area State Pol.,
especially while he is travelling.
Airport police or security can also be good.
Have fun,
Phil

Source record: 234473

You can find the laws within the Philadelphia/South Jersey Scanner Master pocket guide, available from Scanner Master publications 1-800-SCAN-701

However, to summarize, It is perfectly LEGAL to use a scanner in the State of NJ unless you are
using the radio in conjunction with commiting a crime. This is a relatively new law that was
put into place during the Florio administration. The OLD law , which is superceded by this new
one stated that mobile scanning was illegal unless you were a public saftey official or vol fire fighter, etc. Note that any use base, mobile, portable is Legal under the new law.

Hope this helps

Mil sats are a "hit and miss" situation. They are probably the most
challenging comms to try to hear on a scanner.

The ones that I have been able to hear are all on NFM in the 261-262.5
Mhz range.

The 261 Mhz range seems to be the most active, according to Monitoring
Times Magazine, etc.

I haven't heard any voice comms for a while, but I do hear some
digital data bursts. Of course, its just noise.

: criminals access to police communications, or letting civilians listen in
: as well? It's tough to decide which should be done, isn't it?

I'd say (perhaps from a somewhat biased perspective 8*)) that a department is much better off with the extra eyes and ears. As I argued before, it just makes good sense from the public relations end of things to have folks out there that understand to some extent how law enforcement works. And sometimes you're gonna get lucky - someone's going to spot that hit&run vehicle abandoned in a gas station parking lot. [Of course, there's a small but all-too-real chance that when the officer arrives on scene she's going to find some wannabe grilling everyone at the pumps for clues]

There's an old addage that says something like - if there weren't any dumb crooks we wouldn't have any crooks at all - meaning that the smart ones don't/won't get caught. Few if any petty crooks are going to sit down and systematically study a department's tactics - mapping out RD's, shift changes, looking for patterns in how backup units are dispatched, how they deploy and the like. The crook that does, initially, may be hard to catch [face it - you're up against someone with a brain], but it's only a matter of time. Unless the crook has photographic memory and unlimited resources, his attention to detail [and pride in his work] are going to limit him to a finite area of operation. With MO and range in hand, the PD deploys and waits. Of course, communications security is part of the deployment plan, and if the department is smart, it's not just a matter of switching to scrambled on dispatch, but more like switching to borrowed buisness band radios or something on that order.

In other words - you gain relatively nothing by going to routine scrambling. The dumb ones are going to get caught just as easily, and for a while the smart ones are going to get caught a little sooner [if they're smart they'll adapt - the first rule of comsec is that you have to assume every system has holes that can be exploited - and that they will be].

I'd wager that the best solution to exactly the the issues you raise is much better then a compromise. Develop a department-wide comsec policy, and *teach the officers to use it* [that probably means holding regular com-sec drills. Perhaps as an addition to normal tactical drills]. Regularly re-assess your environment, and make adjustments to the policy as needed. The use of toys [ie, scramblers] is not forbidden, but make sure there is an understanding of just exactly what that buys you [suddenly dropping into scrambling may cause a suspect to jackrabbit -

constant scrambling will alienate the community and more dangerously, the components in the community you rely on, like civilian review panels, watchdog groups, the press and the like]. Teach the officers common sense - scrambling is not going to reduce the risks encountered in responding to a domestic dispute for instance. Nor will it protect them from ambush. Those who would push scrambling as a panacea are setting a lot of young cops up - by leading them to believe they're invulnerable, shielded by technology. Good com-sec training should and would emphasize that they're always vulnerable, and give them the skills to minimize their exposure...

Motorola, GE, et al have a product to sell, and they're doing that quite well by whipping up fear and presenting knee-jerk reactionary solutions. A lot of municipalities are buying in to that [hell, who needs to give it much thought - the taxpayers will buy it as being yet another notch up in the war on crime, the officers buy into it on the safety myth]. In the end, we're likely to find we're stuck holding an awefully expensive bag. The toy's aren't going to lower the crime, nor are they going to add much (if anything) to officer safety without real work on comsec - and real comsec training would likely eliminate the need for the expensive toys...

2888. Reg. freqs, RS transcievers, etc

What's the fcc regulation that says whether a business has to register their frequency? Is output power the criteria?

Also, do many businesses operate on the itinerant frequencies? I often have trouble finding security agencies, parking lot attendants, and the like. I know that sometimes there is a larger company based in another city that actually owns a local business. If say a privately owned small parking lot were using like
1-2 watt transcievers, would they have to register?

Are there any handheld transcievers out there that operate at 29-54mhz ?

I know that radio shack sells a scanner the PRO-2307 currently for
like 99.99 on sale. This scanner any decent?

I'm often looking for frequencies where the activity on the frequency is here and there. ie not always transmitting. My Alinco Dj-580T scans, but is fairly slow, taking a very long time to go thru all the available bands. Question, how is it that you guys find these? The distance is too great for any
freq. counter.

As always, I'm looking for frequencies in and around the Metro Pittsburgh area.

Keith

I know that ScanStar can interface with the Optoelectronics OS 535 board. The 535 enables a Realistic Pro2035 or Pro2042 to have computer control. I am not sure if the 535 interfaces with
the Pro2030. You can contact Optoelectronics at http://www.optoelectronics.com or ScanStar at http://www.sscanstar.com for details. I have ScanStar connected to my ICOM R-7000 and I think it is GREAT!

Hello!

I'm planning a trip from Oregon to MT. Any frequs would be greatly
appreciated, I'm mostly interested in State Police / Highway Patrol.
I've got the Oregon information, and some Washington but would appreciate
information about Idaho and Montana, either the frequs or someplace on
the net where I could find them.

I'll be following I-84 east in Oregon to I-182 north to Washington, through the Tri-Cities and North to Ritzville,
and then east on I-90 through Northern Idaho and into Montana. My final
destination is Helena. I'll be pulling my car behind a U-Haul so this is
purly a recreational request.

Any information is appreciated. Feel free to either post or E-Mail.

The Canadian Icoms and AORs I've seen have been unblock in the cellular freq bands, but the Bearcats and the RS scanners were still cell blocked!

The scanners from the UK seem to all be unblocked (even Bearcats and RS brands). UK prices and of course shipping is $$$ though.

In general, here are the mods you can perform:

Speed Mod:
Replace microcontroller oscillator/xtal with a 2X xtal. Doubles scan and search speeds (good), halves delay times and keypad debounce times (bad). You may even be able to go for more than 2X, but then you delay and keypad debounce will be virtually nonexistant! This is usually a simple mod to perform.

Memory Mod:
Replace RAM IC in the unit (make sure there IS a RAM in the unit, some may have RAM in the microcontroller) with a larger RAM and "page swapping" circuitry on a separate (small) PC board. This if very difficult and very time consuming. You also need to know something about digital circuits if you don't have a goof-proof, step-by-step mod instruction. It's well worth the extra money to buy a unit with the memory you want already installed, unless you just like messing around with mods!

Freq Gap Restoration:
Not likely. Most scanners have gaps because the RF circuits cannot tune in those ranges. Cell mods work because the RF circuitry is there, but legal requirements force blocking access to the cell freqs. If you want full coverage with no gaps, buy a full coverage receiver. And while your spending the money for a full coverage receiver, you might as well consider one that is cell modable!

>They appear to be "PL" and not "DPL".

>They are used to access the RF channel assigned to the Talkgroup, and
>are assigned system wide.

>Hope this sheds some light...

>Z

ADDENDUM:

I looked at the connect tones at work today, and they do look like a
DPL rather than a PL tone, yet the manuals led me to believe that they
were PL...

Curious that.

Z

ANOTHER BULLETIN:

The portable/mobile transmitts a "PL" tone and the repeater
transmitted a "DPL".

Curiouser and curioser...

Z

Further info:

I did some research today and (re)found out that it works like this:

The units transmit a PL type connect tone to access the systems
repeater it has been assigned to.

The repeaters transmit sub audible data on all active channels along
with that particular channels voice traffic.

This data on the assigned voice channels contains some or all of the
following information:

a. The assigned talkgroup that is supposed to be on that RF channel.

b. Priority talkgroup channel assignments (used for "scanning users").

c. Data for Call Alert or Private Call functions.

d. Disconnect tones (tells the radios to return to the control channel
for further instructions).

e. Possibly individual I.D. commands to return to control channel.

f. Possibly more as yet undetermined stuff (Report your activity for
a "snapshot", inhibits, etc).

As I find out more I can post, if anyone is interested.

INSTRUCTIONS

Follow these instructions EXACTLY, and in 20 to 60 days you will have received
well over $5000.00 cash, all yours. This program has remained successful
because of the HONESTY and integrity of the participants. Please continue
its
success by CAREFULLY ADHERING to the instructions.

Welcome to the world of Mail Order! This little business is somewhat different
than most mail order houses. Your product is not solid and tangible, but
rather a service. You are in the business of developing Mailing Lists. Many
large corporations are happy to pay big bucks for quality lists.
(The money made from the mailing lists is secondary to the income which is
made from people like yourself requesting that they be included in that
list.)

[1] Immediately mail $1.00 to the first 5 names listed below, starting at
number 1 through number 5. SEND CASH ONLY. (Total investment: $5.00)
Enclose a note with each letter stating: "Please add my name to your
mailing list". Include your name and mailing address.
(This is a legitimate service that you are requesting and you are paying
$1.00 for this service.)

[2] Remove the name that appears as number 1 on the list. Move the other
9 names up one position (Number 2 becomes number 1, number 3 becomes
number 2, and so on). Place your name, address, and zip code in the
number 10 position.

[3] With your name in the number 10 position, upload this ENTIRE file to
10 (ten) different bulletin boards. You may post it to the BBS's

message base or to the file section. Name it FASTCASH.TXT, and
use the
file description comments to draw attention to this file and its
great
potential for all of us.

[4] Within 60 days you will receive over $5000.00 in CASH.

Remember, as each post is downloaded and the instructions carefully
followed,
five members will be reimbursed for their participation as a List
Developer
with $1.00 each. Your name will move up the list geometrically so
that when
your name reaches the number 5 position you will be receiving
thousands of
dollars in cash.

REMEMBER - THIS PROGRAM FAILS ONLY IF YOU ARE NOT HONEST -
PLEASE!!
PLEASE BE HONORABLE...IT DOES WORK! THANK YOU

> -Will Flor willf@rrgroup.com

About a week ago, I made some pretty strong assertions about whether or not Will Flor actually knew what he was talking about with respect to scanner laws. After that, I was not able to read the newsgroup for 5 days. My ISP "expires" most news articles after 3 days, so if there was any followup to my posting it had rolled off the news server before I got to see it.

In any event, the above posting demonstrates the exact opposite of what I had stated regarding Mr. Flor's understanding of the law. Since I can't go back and review the messages that led to my diatribe, I can't prove anything, but I'm willing to bet that I misattributed a quotation in a thread. It is quite obvious from the above that Will Flor does indeed know what he is talking about.

I retract any earlier statement to the contrary, and I hope Mr. Flor will accept this public apology.

1. Sort of like an ocilloscope but it displays signal activity across a wide band so that you can watch, say, 10 MHz of bandwidth at the same time. Signals appear as vertical lines on the screen. The hight of the line is determined by the signal strength. Neat devices, but usually cost from $1800 to $60,000.

2. Continuous tone code squelch system - also known as PL (Private Line) which is a Motorola trade name. This is a sub-audible tone (in the 60 to 200 Hz range) that is sent by the transmitter in addition to the actual voice signal. The receiving radio will only open its squelch if it detects that tone. This allows multiple radios (or agencies) to be on the same frequency without having to listen to unwanted traffic.

3. I forgot what this stands for, but it is a very common form of digital paging. It describes the format of the digital signal. If you want to decode pager signals, you want a decoder that will decode the POCSAG format. Another format that seems to be less common now is GOLAY.

Their have been a lot of changes and upgrades to radio systems in Ontario over the past few months and even more so to come. communications Canada does not publish public service frequencies and Government material. My concern is that those of us who may be interested in your data base may find many missing frequencies or out of date material.

I looked into Percom web site and noticed I could not sample the canadian data base. How can I know what I'm buying?

If guys like myself who monitor for a living the emergency service have difficulty keeping up to dat how can this company?

When was the material obtained? and how is it updated?

Has anyone used these cds and how much luck have you had with new listings?

On this matter, the radio guy from the Williams GP team was interviewed on Dutch TV on this matter, and he said that used a "very simple but effective" scrambling system, that was only meant to deny listening in to the casual listener, but that determined ppl. could easily do so. He also said that clear communications (i.e. identifyable what is being said) was their main concern.

But a few years back ('94), a sophisticated device was used by the Benetton team to scramble Schumacher-Engineer communication... too bad that I don't have the tape anymore... they zoomed in on the device's LCD read-out. Of course I didn't have a scanner at that time :)

We have a Radio Shack PRO-2037 scanner and have added a Radio shack 20-006 (cat.no) scanner antenna to the back. That's one of the collapsible antennas with the black thingie in the middle.

We live in Kennesaw, about 40 miles NW of downtown Atlanta and we're getting ready for Olympic listening. We're having trouble picking up some of the Atlanta police frequencies in the 800-mhz range. We're looking for indoor antenna recommendations to help in that range. We don't want to put up anything outside or even in the attic. How's the Grove "hidden antenna"? Would something else do better for our needs?

If you mean a review that compares all of the available scanners within a certain price range, I don't recall ever seeing one. Monitoring Times sometimes compares two similar scanners, say the 2035 v. the 2042 or Uniden with the Rado Shack version of the same scanner...

It's unfortunate, but neither MT or PC really does a good job covering scanners. Sure, they write about scanners but they don't do much in the way of comprehensive reviews. [Puts on flame resistant underwear] The truth is they're more beholding to their advertisers than their readers. [Ducks behind a large boulder, while yelling "Fire in the hole!"] I used to subscribe to both of them but since let my subs lapse.

1. Spectrum Analyzer - Tool used to graph radio frequency usage in the immediate area. One of the many uses is to locate frequencies of local transmitters. The ones that I have seen look similar to an oscilloscope, and the signal strength is plotted on the Y axis, and the frequency on the X axis.

2. Continuous tone-coded squelch system - When a radio is used to transmit, it automatically transmits a sub-audible tone at the same time. A receiving radio will receive the transmision, but only send it to the speaker if the CTCSS tone is present. This allows multiple users to use the same freqency, without having to listen to all of the transmissions from the other users. PL - Private Line is also another common name for CTCSS.

3. POCSAG - Post Office Code Standarization Advisory Group, Digital encoding technique Developed by the British Post Office, commonly used for digital pagers.

I've heard a lot about Motorola from other people in the USA. Are they
the leading manuafacturers of encrypted radios? IIRC from my last visit
to Florida, most users had Motorola. I had a strong feeling it would be
encrypted, after what other people have told me. GPS would certainly be
a good, if expensive idea, IMO.

No, he probably can since most cell antennas are co-linear with a loading coil in the middle. I've only seen about 1 in 100 cell antennas that are 1/4 wave. If its a 5/8 over a 1/2 etc, he might have enough to make a 1/4 on UHF. But it means trashing a good cell antenna. Better off to buy a new UHF antenna.

>freq bands, but the Bearcats and the RS scanners were still cell blocked!

Looking at the specifications and comments it would seem that the likes of Uniden and RS see both here and Canada as the same market. I guess they just use one central distribution unit so those sold in Canada are just the same as those now sold here.

>The scanners from the UK seem to all be unblocked (even Bearcats and RS
>brands). UK prices and of course shipping is $$$ though.

My UBC-3000XLT was a little under $400 which is not much more than I would have payed local. A friend has recently received a PRO-26 for less $$ than he could get at his local RS and he gets full coverage.

Harry.

Sorry to burst the bubble, but if this is the same TAFL which is available through the net, most, if not all the police frequencies are not included. When I asked my friendly radio inspector why this is, he stated the government classifies police freqs as secret, and therefore they are not included on the publicly available TAFL. When I told him there were some RCM Police freqs on my copy, his reply was 'must of been an oversight.'.

I know with the Radio Shack models, they're the same. I think that's simply to prevent Americans from crossing the border and purchasing an unmodified scanner. Under current Canadian law, it's not illegal to listen to cellular, but it is illegal to repeat what you have heard. Which is the same for any other thing you hear on the scanner. As far as I'm aware, there is no law making companies to produce blocked scanners for the Canadian market, but seeing as most of the scanners come from the U.S., they don't bother producing two different versions. Actually, I goofed, there are some additional bands on the scanners I bought. There's a WX button to scan the seven freqs. that Enviroment Canada has set up for weather info.

The European/Australian model of my handheld (PRO-25) has the blocked bands available.

> Jonathan
Question 1

The possible receive frequencies are determined by the combination of
the Local oscillator and the IF filter frequency not by the tuned
frequency. The tuned frequency
The situation is best explained by an example:

lets say the scanner has a 10.8 Mhz first IF and uses Low side
injection for the fist Local Oscillator (LO1)

For this scanner, receiving at a particular frequency x (let's say
162.40 MHz just to have a number) the first local oscillator must be
operating at one of the following
x+ 10.8 MHz
x - 10.8 MHz
for our example freqency
+162.40 + 10.8 = +173.2 MHz
+162.40 - 10.8 = +151.6 MHz
for the discussion I selected low side injection, and so the
oscillator is operating at +151.6 Mhz in order to tune this
particular frequency. This LO is mixed (added to or subtracted from)
the frequency of ALL signals available at the mixer input.
Our primary signal 1s at 162.40 Mhz resulting in mixer outputs of
+151.6 + 162.4 = 314 MHz
+151.6 - 162.4 = 10.8 MHz

So lets say another signal at 173.2Mhz is also transmitting at the
same time,
+151.6 + 173.2 = 324.8 MHz
+151.6 - 173.2 = 21.6 MHz
now these 4 output frequencies are fed to the Intermediate frequency

section. Since we said the IF is 10.8 Mhz we have a filter there
which is at 10.8Mhz with a passband of say 1 Mhz (+/- 500Khz). Any
signal within the range of 10.3 to 11.3 Mhz passes through the filter
and is heard.
So for our example 4 frequencies come out of the Mixer but only one
(the one at 10.8 Mhz) passes through the filter and is further
processed!
For our design, tuned to ï¿½receive 162.4ï¿½ there are two signals which
might be received (assuming no LO harmonics exist!)
For this example signals are heard at
+151.6 + 10.8 = +162.4 MHz
+151.6- 10.8 = +140.8 MHz

140.8 is the image frequency (since 162.4 is the desired frequency)
Question 2 and 3 all radios using hetrodyne (mixers) are subject to
images. However by using multiple conversions the Loï¿½s and Ifs can be
chosen such that the images fall out of band and are blocked by the
front end filters. For our example... suppose that the 1st IF was
400Mhz

162.4 +/- 400 Mhz = possible Local oscillators at 237.6 or 562.4.
Lets choose the 237.6 oscillator (LOW SIDE INJECTION AGAIN).
the desired frequency is 162.4MHz and the Image is at 637.6mhz a Front
end filter which passes say all freqs from 120 to 175Mhz will easily
block the image frequency Not so with the first design.
then we make the second LO at 389.2Mhz resulting in a 2nd If of
10.8Mhz and so on.

So the reason that tripple conversion receivers are more image imune
is because they can set the 1st IF at a high frequency, the second and
3rd low and have a easy front end filter design!

Question 4:
All bands have images! The deciding factor is the radio design.
Obviously a design which results in image frequencies in seldom used
sections of the radio spectrum will appear to be a better design than
one with images in the comercial radio band, TV band (where strong
signals exist) or so close in frequency that other signals in the same
band pass through the front end filter.

Depends on the state...

Here in Florida, the prohibition against mobile scanners refers to devices that are "permanently mounted" in a vehicle. So, the obvious question then becomes "what is the definition of 'permanently mounted'? What if you connect that handheld (not "permanently mounted") to an outside antenna (which is "permanently mounted")? What if you use a magnet-mount or gutter-clip antenna instead. And...what about power? If you hardwire it to the vehicle's electric system, is it "permamently mounted?" What if you use a cigarette lighter plug instead?

Confusing, isn't it? You'd think our state legislators would have more pressing issues than enacting nuisance laws like this.

Anyone doing the following:

The NWS is conducting tests on our own GOES 8 satellite, at 75 degrees W, elevation 45
degrees (from the latitude of Washington, DC). The initial test for interference with WEFAX was
done in March 1996. An extended test of EMWIN reception is now underway, starting 2 April
1996. The downlink frequency used for the EMWIN datastream is 1690.6 MHz, 400 KHz lower
than our standard WEFAX 1691.0 MHz signal. The signal can be received with various sized
dishes, passed through a down convertor, and received as if a Radio signal at 137.1 MHz. We
hope to conduct more extensive tests to determine minimal, low-cost equipment requirements.

The above taken from the NWS WWIN Page.

I be interested in equipment your using, sources of equipment, sucess, problems, etc..

Thanks.

>question... if it takes 10-12 hours to charge a drained nicad pack using
>the ac charger (output 300ma), how long will it take to charge the pack
>if you used 12 volts straight from the car battery?

bw:

12v gel cells will charge much faster off the car battery (mine is 3 hrs, I think) versus off a wall charger (mine is 8 hours). HOWEVER, this is something the manufacturer indicates is kosher and gel cells are not nicads. I would be concerned about the charging current rating for your nicad pack. It could be they will be damaged by connecting them to the car battery without some sort of current limiting arrangement. In fact, depending on the nicad "pack" you have, the limiting could already be built into the pack, so you'd be no better or worse off using a car battery.

If you can get the max charging current specs from the nicad maker (assuming no built-in current limiting set-up in the pack), that's the best solution. If not, and you're sure there is nothing in the pack but nicads, (and you're a risk-taking sort of person) you may want to try charging at say 1 amp from the battery and see what happens. If they start getting rather warm, more so than using the wall charger, you are probably getting close to damaging them and they could even explode. If they take an amp okay, that seems like a reasonable point at which to compare charge time with the wall charger. I'd be reluctant to go beyond 2x the known current rating (i.e., the 500 mA the charger produces) without knowing the specs.

If you really wanna have some fun, you can always respond to any comments that the order clerk makes on their internal comm while waiting at the drive-up speaker. This will freak out the clerk that made the comment, because they begin thinking that the wrong button was pushed and everthing that was said went out over the speaker.

From: blythe@wilmington.net
Message-ID: <4mo6vu$ih5@news.wilmington.net>
Source record: 234364

I'm thinking about installing a discone antenna in my attic and I'm tyring to decide on either the Grove ANT-9 or the Radio Shack discone.

Since low-band reception is important to me, I would need to have an antenna with a special center element for that band. The Grove antenna comes with this but the Radio Shack antenna does not. I know that there must be a way to add a simple low-band element to this antenna, so I would still consider purchasing it if this is in fact possible.

I'd like to hear any opinions on these two discones. Also, if someone has instructions for adding a center element to the Radio Shack antenna (or can point me to a relevant FAQ or back issue of M.T.) I would greatly appreciate it.

Thanks!

Marshall Blythe

2944. Help for air band antenna ?

Newsgroup: rec.radio.scanner
Date: 1996-05-07 00:00:00 UTC
From: magenois@qc.bell.ca
Message-ID: <Dr1s50.I00@on.bell.ca>
Source record: 234367

Hello,

I have a Pro-37 scanner and I use it to listen to air band most of the time.

Where I was living before, I was at about 4 miles of the airport,
and I was also higher than the airport. So I was able to pickup the ATIS &
ground control transmissions with the rubber duckie antenna.

But I moved, now I'm about 15 miles from the airport. I cant hear ground, ATIS
anymore, and I even loose plane transmission when they are in final.

I am not a scanner/antenna guru.

So what kind of antenna I need ?
Will I will be able to listen to ground control transmission again ?

I would like to be able to put the antenna into the roof (not on...),
I know it's not the best, but it's a brand new house and I do not feel
like drilling holes in the roof yet... :-)

I will appreciate any help.

Marc

From: CYBRCHLD <lrpena@gil.net>
Message-ID: <318FBCAB.7FF6@gil.net>
Source record: 234368

here is a way to do this by using some math calculations and a motorola phone in test mode. and i works cuz i've done it. but it's a pain in the ass .

This hack assumes you can:
1. put your MOTOROLA phone into test mode
2. unmute audio
3. load channel numbers until you find something worth listening to.

Problem: When listening to something interesting (a conversation), just when that sexy sounding horny broad begins to give her phone number to some lucky guy, HANDOFF!!! then static... DAMN!

Trick: Hack the FOVC.

a quick definition: FOVC = FOward Voice Channel
FOCC = FOward Control Channel
REVC = REverse Voice Channel
RECC = REverse Control Channel

As the phone travels through cells, the FOVC is where the tower tells the phone to adjust power levels for the current cell or to change to a new channel for use in the new cell. This info can be hacked apart. So. When you've found a good conversation, don't be lazy! Enter 40#! This makes the phone listen for commands on the voice channel (embedded in the audio portion- you can hear it as a "bump" sound). It will just sit there and the display will read '40' , but the conversation will still be audible. Now when the phone receives a FOVC command (a 40 bit sequence) data will flow across the display, in hex format, and stop. Listen to the phone, if the conversation is still there, then the command was only to adjust power levels. If the conversation is gone, then its a handoff. If you only got a power adjustment command just press # or clr, which ever gets you back to the ' prompt. Enter 40# and keep listening. You can also use the # key to cancel the 40# command, if you want to change channels or something.

If it was a handoff, its time for some quick math. You have to convert some of the numbers to binary, and then to decimal. I don't know how many characters your phone's display will show. Mine only shows the last seven of the ten hex digits. Count left from the end 6 digits. Write down that digit and the next two on a piece of paper, ie:

???j16djjj j=junk numbers (hex numbers range from 0-9,a-f)
/ \
these are lost due to scrolling

write down 16d then convert it to a binary string:

1 = 0001
6 = 0110
d = 1101 (d=13)

now you have a binary string like this: 000101101101
throw away the first 2 bits and get: 0101101101
convert this to decimal and get: 365

365 is the new channel the conversation has moved to! Enter 110365#
and voila! You too, can hear the horny babe's phone number!

Don't forget to enter 40# again, as the call may be moving quickly
through cells (small cells or freeway driving) or the call can get
bounced around by the tower for cell traffic purposes.

Here's one more example of the hex>binary>decimal conversion.

???j5aejjj

5 = 0101
a = 1010
e = 1110

full string = 010110101110
truncate 2 msb = 0110101110
convert to decimal = 430

have fun......
CYBRCHLD.........:)

There are several possibilities.
One of the best is this: the other scanner is receiving an image, which your
scanner isn't receiving.

2954. New: Optoelectronics Explorer

Newsgroup: rec.radio.scanner
Date: 1996-05-07 00:00:00 UTC
From: footage@well.com
Message-ID: <footage-0705961900390001@footage.dialup.access.net>
Source record: 234377

I called Optoelectronics yesterday in search of advice on whether I should update my Scout and Interceptor and heard they will be releasing a new product called the "Explorer" for a SRP of $899.00.

The man with whom I spoke claimed that the Explorer combines a Scout, an R10 Interceptor (FM) and a DC440 (PL, DPL and DTMF tone monitor/display) into one unit. The unit combines the latest software and hardware revs. of the Scout and Interceptor and physically resembles the Interceptor but with a wider case to allow for additional display and controls. It will also be able to drive compatible scanners capable of reaction tuning.

He indicated it would show up on their website later this week at http://www.optoelectronics.com

I have no idea how this product will perform but I'm sure it will be the subject of many postings.

>> the Grove is dos right?
>>
>> Thank You

I can't speak about the Grove CD, since I have never used it, but I can
tell you a little about the Spectrum CD. I like it a lot, it has the most
used fields (freq, call, city, county, state, long, lat, service, user,
etc) and a stand alone search program. If you have the disk space and a
decent database program like FoxPro or dBase, you can design your own
searches. Spectrum runs on Mac, Windows, Dos, or Windows 95. I think it
will run on OS2, but I am not sure.

I am sorry I can't speak about the UL capabilities, as I don't currently
use them. I am sure others will fill you in on this.

Enjoy!

>>JM

On non-trunked systems, standard PL and DPL tones are used. For example,
a town near me uses 855.2125 in a conventional repeater, with a PL tone of
162.2. Another uses 857.4875 with a DPL code of 023.

It's on the high side of K-band. Don;t think the scanner will recieve
it.. I want to say 24.940 GHz for one. Theres actually two freqs, one for
road alert and one for emergency vehicles.

From: mwandel@bnr.ca
Message-ID: <4mmaor$3qq@bcarh8ab.bnr.ca>
Source record: 234430

I got a Radio Shack PRO2020 scanner at a garage sale and can't figure out all its features. Specifically, what does the "monitor" button do? You enter two digits and then the scanner locks up until you press "manual". What do the up-arrow, down-arrow and "limit" buttons do? The first two appear to look for an active frequency, but how do you set the starting frequency and how do you store the result?

I can't figure out how to listen to a particular frequency entered from the keypad without assigning it to a channel and then listening to that channel.

Any help appreciated.

>canadian data base. How can I know what I'm buying?

Please know that the online version only offers very limited US data
searches.

The new PerCon Summer 96 catalog shows: SPECTRUM CANADA ($49.95+) CD
ROM.

Over 500,000 records form Industry Canada Technical and Frequency
Lists. Text advises that the data includes: PD/FIRE/HOSPITALS/
BUSINESS /Prov. & Local GOV'T/AIRLINES/UTILITIES/HOTELS/THEME
PKS/TAXIX/FREIGHT Co's/PHONE CO's "and much more". "From DC to
Daylight".

The picture shows a 'Windows -type' display with data that includes:
Frequency/Receive Frequency/ Callsign/ Licensee /Location. SIC
Code/Class of Sta./TX. Long. & Lat./ #of Mobiles and Base also avail.
within the data base.

Text also advises that the data supports OptoScout data: 'Scout data
files can be read and compaired with matching frequencies from the
data base'...

Ready for shipping: May 2, 1996.

Hope this helps!
Uncle T.

Yes!

The Pres was in L.B., CA. and one motor unit on PD frequencies started naming the ramps he/they passed and as soon as he unkeyed' three stations jumped him to tell him NOT to name the exits, only to 'hand-off' to other units as they progressed.

From: puregold@crl.com
Message-ID: <318ee9d2.9883273@nnrp.crl.com>
Source record: 234440

Can anyone get me the 5200 channel mod for the Pro 2006 scanner. This mod should give something like 26 banks of 200..or something like that.

Anyone do this mod? If so..what type of switches did you use and where did you place them.

Any help as to the mod would be appreciated.

I already did the speed mod and the cell mod and it works great!

Thanks

J

Dave I just bought one last month from the FFClub . I don't use my
HT to much, but when I need it guess what the battery pack is low!
This alkaline pack solves that problem. Plus you get a lot more listen
time. My next handheld will be a Radio Shack,because they do have
the opyion of Nicads or Alkalines. I don't understand Uniden, why they
don't include this simple option.

Regards,

I've had it for a year or so - I agree that the interface is minimal, at best. But the information and value are good. I use Access to attach to the data, extract to an Access file and then develop reports or queries to meet my needs. I just did an extraction of all transmitters located within 1 degree of my home. Ended up with a file of 7000 records that's very manageable. I've also done extractions in preparation for trips.

>it if this is in fact possible.

An additional element can be added to the center element of the Radio Shack
discone. You need to make an adapter sleve that will attach to the center
post of the RS antenna, and allow you to screw the add-on section to it. This
is fairly simple, and gives greatly improved low end performance. Cut your new
central element to your most desired frequency. If you don't know what freq
you want best receptiion on, try a standard 4 foot CB whip. It should do
everything you need.

Ban the word ban.

Nice job of not answering the question.

Here is the correct info "ME" requested:
Any 'CBer' may operate AM or SSB (Upper Side Band or Lower Side Band) on
any of the 40 assigned channels. Most SSB operation is around channels 30
- 40, where they try for long distant contacts (DXing).

Ciber@RT '96

First Internacional Conference on Virtual Reality

CALL FOR CONTRIBUTIONS

November 4-7, 1996
Valencia, Spain.

Ciber@RT '96 is an annual international conference that has risen from the need of creating a space open for discussion and reflexion about the non-stopping evolution of New Technologies and its relation to the Art & Communication world. The present edition is fully dedicated to Virtual Reality, its social and artistic implications, its practical applications and the development of new interaction proposals, as well as the emerging phenomena of Virtual Communities.

Conference Format:

Ciber@RT '96 will start on Monday November 4th, and it will be developed during the three following days (November 5,6 and 7). Four masterly presentations and an undetermined number of communications will be presented. Electroacustic music concerts, performances and virtual art exhibitions will extend the programme to create a wide interdisciplinary spectrum for theoretic and creative brainstorming, debate and discussion. Every presentation will include simultaneous translation to English and Spanish. Communication sessions will be run in sequence, avoiding parallelism.
The Conference will be a part of the "Second International Show on New Technologies: Art & Communication", where infographic works from schools and universities from all over the world, as well as special presentations, will be held.

CALL FOR COMMUNICATIONS

The participants interested in presenting communications should send a summary to the Conference address, containing:

- Title of proposed communication
- Author(s) personal data (name, address, e-mail...)
- Institution (if any) and position
- Addressed area (see list below)
- Abstract of communication (500 words maximum)
- Brief curriculum vitae of author(s)
- Technical equipment requirements for presentation

This summary, including all documentation, can be delivered by ordinary or electronic mail (in the first case, a PC or Mac formatted diskette with the text and a hardcopy should be enclosed) before the reception deadline.
The text of the communications and the speech can be in English or Spanish.
No previously published communication will be accepted. All accepted communications will be edited and published by the Universidad Politecnica de Valencia after the Conference.

DEADLINES

Summary of communications reception: July 25, 1996.
Acceptance notification: September 10, 1996.
Advanced registration: September 30, 1996.

Selected authors will be informed of the deadline for the final version submission.

REGISTRATION AND FEES

Advanced registration fee for participants in the Conference will be 20,000 pta., and 15,000 pta. for students. This fee will give the right to attend all activities of Ciber@RT'96. Registration after the advanced deadline will have an increased fee.
Participants will receive a Certificate expedited by the Universidad Politecnica de Valencia.
The number of participants in the Conference is limited, so that early registration is encouraged.

MASTERLY PRESENTATIONS

JARON LANIER (USA): (to be confirmed)

Visionary programmer, postminimalist music and cyberculture philosopher, he is one of the few persons in the planet that can be proud of having started a new industry. He developed in 1985 a new symbolic programing language, and in a few years he became a famous 'cyberenterpriser', owner of one of the world's strongest companies in the field (VPL). He sold its cyberglove to the NASA, and he begun to use the term 'Virtual Reality' in 1989, being one of the first persons to design virtual equipment. Nowadays he is associated to the University of Damouth (USA) leading several Robotics and Telepresence projects in the field of medical applications.

PHILIPPE QUEAU (France): "Virtual Presences"

Telecommunication Engineer and Research Director at the INA (The French Institute de l'Audiovisuel), he is one of the best international specialist in the study of synthetic images. He is also the responsible person for the IMAGINA Festival programme at Montecarlo, one of the most important festivals in the european field of New Images.
Brilliant theoretician, he has written books as "Eloge de la Simulation - De la Vie des Langages a la Synthese des Images" (1986), "Metaxu:

Theorie de l'Art Intermediaire" (1989) y "Le Virtuel: Vertus et Vertigues" (1993).

MONIKA FLEISCHMANN (Germany): "Me and you: New Dialogues in the Cyber-Age"

Artistic director of the Department of Visualization and Design of Media Systems (VMSD), and responsible of the area of computer art of the GMD (Sankt Augustin, Germany), one of the most important European research centres in the field of computer sciences and information technologies. She was co-founder in 1988 of the Institute of Interdisciplinary Research on Art and New Technological Media ART+COM. Presently, Monika shares her work as main responsible of the CYBERSTAR Festival, oriented towards the search of interactive proposal for TV, with the realization of Virtual Reality projects and interactive installations that question the sensorial perception of the spectator.

ZUSH (Spain): "The Augmented Reality"

Highly reputed plastic artist, he is one of the computer art pioneers in Spain. Part of his art work has been developed as a collaboration with the Massachussets Institute of Technology (MIT). He is presently creating images for the Web, producing a CD-ROM based on his work, and he is also involved in an interactive project of the Instituto del Audiovisual of the Universidad Pompeu Fabra named 'Arte para Curarte'.

SUGGESTED AREAS FOR COMMUNICATIONS

1.- VIRTUAL REALITY AND SOCIAL IMAGERY

New markets and new ways of social control generated by synthetic realities.
Which types of virtual hallucinations and visual drugs are generated by virtual reality?.
Virtual environments and mass-media.
Economical and social impact of digitalization and virtualization of information.
Which role does cyberspace plays in colective consciousness?.
Might it be a new dogma?.
Do virtual techniques help us to better understand and apprehend the world?.
Virtuality and cultural modeling.

2.- VIRTUALITY VS. REALITY

Essence of virtual worlds.
The virtual concept and our sense of reality. New representation systems.
Are virtual realities metaphoric realities?.
In the experience of virtual worlds, which roles do the image and the model play?.
Fanciful spaces and symbolic world: the nature of virtual environments.
Which are the psychological impacts of virtual worlds?.
The potential nature of virtuality.

3.- VIRTUAL COMMUNITIES

What is a virtual community?.
Televirtuality and telepresence.
Symbolic representation of human identity in the cyberspace: clones, avatars, aliases, ghosts, daemons...
Which are our responsabilities in the virtual communities?.
Mask games in cyberspace: private vs. public personality.
Cybersex: which is the role of the body in the virtual worlds?.
Has cyberspace its own life?. Does it scape from human control?.
New algorithmic techniques for network control.
Virtual labyrinths and vertigos.
Hyperimages and hypertext.
Autonomy and tyranny of the cyberspace.

4.- PRACTICAL APPLICATIONS OF VR

Practical applications of interaction technologies.
New application horizons of these technologies in the field of art and communication.
Experience obtained in existing work environments from the technical point of view.
Which is the present state of simulation techniques and what do they consist of?.
Do they offer a real and practical advantage beyond the mere exhibition of technology?.
Are the real time image synthesis techniques capable of becoming tools that allow new ways of world representation?.
Do they produce a deep influence on our way of working, inquiring or amusing?.

5.- INTERACTION TECHNOLOGIES

Up to which point a simulation of natural stimuli has been achieved?.
What is the reason for the present limits?. Devices?. Our ignorance about psychological mechanisms of interaction?. The computer systems that should interpret and produce the stimuli?.
What does the digital adaptation of audiovisual and telecommunication technologies involve?.
Which are the interaction and real-time synthesis technology advances that allow us to feel immersed in a virtual environment?.
What are the navigation techniques?.

6.- ART AND VIRTUAL REALITY

Have the new horizons of virtuality produced a radical revolution in the conception of art?. Has the object idolatry finished?.
Does virtuality generate new art languages with specific properties?.
Which challenges does virtual art bear?.
Interactivity and the artist-public relation.
What is the role of the galleries and the critics when the creative offer can become almost infinite?. The new distribution streams.
The museum in the age of virtual reality.

Does virtual art have a potential nature?. What do we call life of an art work?.
Is the virtual artist an 'intermediate' artist?.
Esthetics and policy in virtual art.

SELECTION OF COMMUNICATIONS

The evaluation and selection of the communications will be carried out by a selection committee and a scientific advisoring committee, composed of the following experts:

Scientific Advisoring Committee:

Xavier Berenguer (Universidad Pompeu Fabra)
Josep Blat (Universidad de las Islas Baleares)
Pere Brunet (Universitat Politecnica de Catalunya)
Javier Echeverria (Universidad del Pais Vasco)
Santos Zunzunegui (Universidad del Pais Vasco)

Selection Committee:

Salvador Bayarri (Universitat de Valencia)
Josep Gavaldat (Universitat de Valencia)
Jose M. Iturralde (Universidad Politecnica de Valencia)
Angela Molina (Director or Ciber@RT '96)
Emilio Rosello (Universidad Politecnica de Valencia)
Jenaro Talens (Universitat de Valencia)

CIBER@RT '96 PRODUCTION & ORGANIZATION

Angela Molina: Director / Chair
Fernando Carrion: Coordinator
Cesar Fernandez: Coordinator
Jimmy Entraigues: Media Manager
Aurea Ortiz: Technical Advisor

CONFERENCE VENUE

Ciber@RT '96 will be held in the Conference Room of the Faculty of Fine Arts (Facultad de Bellas Artes) of the Universidad Politecnica de Valencia.

NewsRadio (jmckay@interlog.com) wrote:

: > --If I had to guess, I'd say that probably every cell conversation in a
: major metro area is being monitored by at least a dozen scanners at any
: one time for at least a portion of the duration of the call.

I don't think it is anywhere near this many. Remember that each nearby group of cells can handle 833 simultaneous conversations. The phone systems are probably loaded at least 60 percent most of the time, so this means that in a few-mile radius there are 500 of so calls going on at any given time. If a dozen scanners are tuned in to *each* call, that means there are *currently* 6000 scanner buffs listening in. I don't think so. Perhaps at any given time there are a dozen scanner buffs total listening to cellphones. I'll bet the chance that any particular call actually gets listened in on is much less that 1 in 1000. And even if the call gets overheard, the listener won't have the slightest idea who he listening to. I don't have a cell phone, but with odds like this it wouldn't really bother me to use one.

2993. Legality of owning a Modified Scanner.

Newsgroup: rec.radio.scanner
Date: 1996-05-08 00:00:00 UTC
From: palomino@ritz.mordor.com
Message-ID: <Dr3uKI.84D@ritz.mordor.com>
Source record: 234250

My friend and I were arguing today about owning a scanner that has been modified. I insisted that *owning* a modified for cellular scanner was not illegal, my
reasoning came from the Scanning FAQ, it says that private sale of modified scanners is still allowed, so lemme get this straight, you can own one to sell one privately, but buying is illegal? I never claimed to know the letter of the law when it comes to this, but it doesn't make sense if one can sell a scanner and not own one.

Is modifying a scanner illegal?

Also, let's say I do have a modified scanner, and for some reason I got busted, would I be charged for listening to cellular just on the basis that my scanner can? the question that comes to my mind is how could the FCC prove I was listening?

My friend made many references to 'illegal' cable boxes, he said just having one was enough to get you arrested, but I said that the crime of listening to a cell. conversation and stealing cable were two different things, given one is an invasion, the other is theft. and I know that if and when I listen to cellular, I will not abuse what i hear (tho technically I'm not supposed to be listen, I won't use the info for personal gain) and it's only for hobby.

Please if anyone has any info, help end the dispute with my friend :)

thanks

Mike

You dont need sophiscated equipment. All you need is the individual password that corresponds to the phone users id number which by the way is not sent over the air but stores centrally. The source code for GSM is available on the WWW, just search for GSM.

So as Dave said, us ordinary people need not bother our minds about decrypting GSM. It`s like cracking PGP.

Rickard.

actually; what you are hearing is this and a sattelite relay, I
suppose. When I've done the same thing, I looked it up and found that

those particular frequencies are actually two things intermittantly:
one, the frequencies are used as mirror images;
and two, sometimes you can hear mirrors of sallelite communications on
this frequency: 1.42 gigahertz (GHz).

3001. REQ:Freqs for Paramount's Great America

Newsgroup: rec.radio.scanner
Date: 1996-05-08 00:00:00 UTC
From: trekker1@usa.pipeline.com
Message-ID: <4moprl$q10@news2.h1.usa.pipeline.com>
Source record: 234258

I would like to request that someone email me the frequencies used by security and medical personnel at Paramount's Great America in Santa Clara,CA. I was hired to work there today. I would enjoy monitoring this amusement park on my off hours. I would also like to receive any other frequencies that might be used there. I have a Realistic Pro-34 200 channel handheld scanner that can use the 800-900 mhz range.

Thanks in advance!!
Chris Halladay (trekker1@usa.pipeline.com)
Castro Valley,CA

: IT WORK.HELP.

I don't beleive there is currently anything around. But when something like this DOES get built, very likely the AR8000 will be the one the radios it works with. Because of the fact that AR8000's interface port has the audio discriminator ouput on one of its pins, as well as being able to "reaction tune" by RS232-like control. I've heard AOR is working on an add-on box which will allow the radio to follow cellular calls when they change cells. Probably only for sale in Japan (this **definitely** will not have the FCC's stamp of approval). Something which followed trunked radio systems is a definite possibility, though, but I have not heard any rumors of it.

> steps 7 & 8 seem somewhat unclear, do you have any
> additional info??

remove 104, then replace it on the two solder pads above the Lithium
Battery. After reassembling the unit, reset the microprocessor (Press
MAN, 2, 9 and turn power on)

NOTE: If the CPU chop reads 1514 or 1514A and the serial number is
below 4500, the mod will probably work. If 1514B, it will not work!

Look for the discone with a vertical antenna element. That supposedly
works better under 50 mhz. I have the ICOM, and it came with 50 feet of
low loss cable and "N" connectors which are very low loss (Can get "N"
to BNC connectors at RS.

I was surprised at the performance of the Scantenna by Grove; and I have
both a discone and a scantenna!

Alot of times the USAF uses 270.1 Mhz for the ATIS Frequency. I'm not
sure if Commercial airlines use the same ones or not. I maintain the
VHF/UHF/HF for my base.

Good luck

3011. Burns Security

A -bit- off topic, but the Los Angeles City Fire Department would like to cordially invite Southern California monitoring enthusiasts & their families to join us at the:

Fifth Annual FIRE & POLICE Car Show and Drag Race

Car Show ---> **** Spectator Admission is FREE! ****

Music, Raffle, BBQ Food and T-Shirts Available
Fun for the whole family

Saturday, May 18th
10:00 a.m. to 3:00 p.m.
Woodley Park
6330 Woodley Avenue
Van Nuys, CA

Classes for ALL types of vehicles. Spectator Admision is FREE.

Drag Race ---> Spectator Admission is $10.00
Kids under 10 are FREE

Sunday, May 19th
Gates Open 9:00 a.m.
Los Angeles County Raceway
6850 East Avenue T
Palmdale, CA

ALL proceeds from these events to benefit the Los Angeles Firemen's Relief Association and D.A.R.E. America

Need more info? Visit the Car Show / Drag Race info Webpage at the:

LOS ANGELES CITY FIRE DEPARTMENT'S INTERNET WEBSITE:

http://www.ci.la.ca.us/dept/LAFD/index.html

OR E-MAIL: <cascio@earthlink.net>

Public Spectators are cordially invited, but participation is limited to Firefighters and Police Officers (any department, active or retired), and their family members.

Stay Safe!

Brian Humphrey
Public Information Officer
Los Angeles City Fire Department

ALL E-MAIL INQUIRIES DIRECTLY TO: <cascio@earthlink.net> ONLY

Depends what kind of radio they have, what mode they fell like
transmitting on, and what position the sideband switch is in. Although
most of the time CB transmissions are AM.

Source record: 234316

Here's an example of someone with a scanner aiding the police, and it happened to me about 90 minutes ago.

I was on a stakeout, waiting to follow an employee of a fast food restaurant in another jurisdiction. In fact, my partner and I were in a car in one city watching the restaurant across the street in another city. All of this was in a different county than our jurisdiction. The police in the city where we were parked knew we were there (I used to work with that city's PD), but the police in the city with the restaurant didn't know about us. We were monitoring both cities' PD's on a scanner.

As we watched, a couple of emloyees left the restaurant after it closed. As the two men walked out and over to a parked car, the dispatcher for that city sent two cars to the restaurant for an employee theft situation in progress. She then said the suspect was walking out of the restaurant and over to a red car. Yup... we were watching the getaway. My partner grabbed the binoculars to get a plate when the two men split up. One began walking dow the street and the dispatcher, who obviously was on the phone with someone inside the restaurant, told her cars the suspect was walking down the street. At that point, I started our car and was going to follow the suspect, hopefully without burning us to our own suspect we were originally watching (who wasn't involved in the theft incident). Just as I was about to reach for the head-lights and drive, the first police car arrived and stopped the suspect. I shut our car down and continued with our own surveil-lance.

Eventually, the police let the suspect leave. That's when I grabbed our cell phone and called their dispatcher, asking her to advise her units that, before the police arrived, the suspect did approach a parked car for a few moments and they might want to turn their attention to that car (I made the call anonymously). A moment later, the dispatcher radioed her units and asked if they found what they were looking for. She then advised them to look in or near the car, as I suggested. That's when they found the stolen restaurant receipts for the night dropped behind some bushes in front of the car. The police then took off after the released suspect.

The suspect could have easily gotten away with his crime. The police released him when they found no evidence on him, and he could have returned an hour later to pick up the receipts after the coast was clear, but someone listening to a scanner and

watching the events unfold knew the police hadn't looked at one place the suspect had been between the time of the theft and the arrival of the cops.

Oh...as for our stakeout, it was effective. The employee we were after left the restaurant a few minutes after the local cops and other employees packed it in. We got our gal. Or will, since we weren't there to arrest her. Yet.

: Over 500,000 records form Industry Canada Technical and Frequency
: Lists. Text advises that the data includes: PD/FIRE/HOSPITALS/
: BUSINESS /Prov. & Local GOV'T/AIRLINES/UTILITIES/HOTELS/THEME
: PKS/TAXIX/FREIGHT Co's/PHONE CO's "and much more". "From DC to
: Daylight".

What a load of shit!! The downloadable IC data is a protected database.
It does not contain police, consulate or military frequencies. IC deems
these 'secret'. The odd frequency has slipped through due to a slipup on
the licensing application but 99% of all police frequencies are missing.

I'm sure most people would regret buying a product that doesn't live up to
it's claims.

> Digital Capabilities?

Yes thats correct. The digital transmission used in the newer cellular
systems cannot be monitored with a regular 800 Mhz scanner. However,
there are still lots of users out there with analogue cell phones so the
cellular systems will still have to be able to work with those phones for
quite some time yet and you can still listen to those calls.

Uneven squelch thresholds (different receiving modes and frequency ranges)
is a design problem with all Nissei-manufactured AOR handhelds. Live with
it.

If anyone has these, and could send me a copy I would surely be thankful!

Even an ascii list would help!

Michael

>The GSM cellular format is digital so you would need a codec for that
>format to monitor it. A standard scanner would not be enough by itself.

Digital cellular systems use a complicated system of encoding and
modulating such that a normal FM scanner and other additional parts,
i.e. codec, will not decode anything.
GSM and the US TDMA are similar. CDMA adds the further complication
of spread spectrum. Highly sophisticated scanners would be needed to
monitor a digital system. A hacked digital phone may be the best
starting point.

First the modulation is not continuous, it is time sliced into 8 channel
slots, each channel gets 1/8 of the frame to transmit the digital bits,
and across 8 frames 40ms of coded speech is transmitted.
Second, the modulation is not FM, it is one of many variants of
amplitude+phase shift keying - in GSM it is Gaussian minimum shift
keying, the pattern of amplitude and pahse is called a constellation..
Third, the digital information representing the codec speech is
encoded with error correcting bits and broken up and recombined
in a process called interleaving to minimize burst errors.

Given the above, the GSM scanner needs the abilities to monitor
a time slot, demodulate the GSM constellation, de-interleave, apply
error correction, and do the GSM vocoding for the conversion of speech.

DJ-460T
1..Expanded RX
DJ-500T
1..130Mhz to 169.995Mhz
2..340Mhz to 379.995Mhz
3..420Mhz to 469.995Mhz
4..870Mhz to 899.995Mhz
DJ-510T
1..Expanded RX
2..Cross band repeater
DJ-580T
1..AM RX 108Mhz to 130Mhz
2..RX/TX 130Mhz to 170Mhz
3..RX/TX 415Mhz to 470Mhz
DR110T/DR120/DR1200
1..RX 130Mhz to 169.995Mhz
2..TX 103Mhz to 169.995Mhz
3..9600 Baud
4..RX 870Mhz to 889.995Mhz
5..RX 340Mhz to 379.995Mhz
6..Cross band repeater
DR510
1..Vehicular extender
2..Expanded RX
DR570T
1..TX/RX 130Mhz to 169.995Mhz
2..RX 340Mhz to 379.995Mhz

3..TX/RX 420Mhz to 469.995Mhz
4..RX 870Mhz to 899.995Mhz
DR590T
1..Cross band
2..Expanded
DX-70
1..RX/TX .3Mhz to 35Mhz
2..RX/TX 45Mhz to 60Mhz
3..TX Mars

AOR
1000
1..Sub band reset

AZDEN
PCS300
1..Pll adjustment
PCS4000
1..Busy/Scan mode
2..Cold problem fix
PCS6000
1..TX 138Mhz to 160Mhz

BEARCAT
BC50XLT/55XLT
1..66Mhz to 88Mhz
2..Test freqency
3..118Mhz to 174Mhz
BC100XLT
1..AM/FM select
2..40 channel /second scan
3..66Mhz to 88Mhz
4..100 extra channels
BC140
1..10 to 16 channels
BC175
1..16 to 20 channels
2..66Mhz to 82Mhz
200XLT/205XLT
1..Extend battery life
2..Cellular restoration
3..Speedup scan
4..AM mode
5..Test mode
6..AM/FM select
7..40 channel/second scan
8..66Mhz to 88Mhz
9..Light mode
250XLT
1..Scan beyond 174Mhz
760XLT

1..Squelch
2..Cellular restoration
855XLT

If you wish to order the mods please send $5 (check or money order) for each radio model (1 radio= $5, 2 radio's = $10, etc.) to:

Jamie Bucher
P.O. Box 15653
Loves Park, IL 61132

Please specify if you want your mods faxed, e-mailed, or sent via the postal service when ordering. It is possible that when we send this information additional mods for that radio will be available, if so we will send them along also.

Please included an e-mail address if I have any questions about your order.

3033. Re: Freq. for the new highaway alert system?

Newsgroup: rec.radio.scanner

3034. Re: NEW SPECTRUM ~ 96 Canada

Newsgroup: rec.radio.scanner
Date: 1996-05-08 00:00:00 UTC
From: doc@dxnet.com
Message-ID: <3190d1a1.11880552@news.dxnet.com>
Source record: 234329

Steve, Rude little boy!

The text I quoted was directly from the 96' PerCon catalog. It clearly states the CD information listed is for Canada and all services I listed were taken directly from the PerCon catalog page. I have not seen or used the CD and my reply was to help others decide if the CD may be of use to them, baised on the information provided by PerCon.

I replied bacause another user advised that he was unable to access any Canada data from PerCon www at all. He was seeking the data to evaluate the scope and content of the data provided on the Canada CD. To assist him in his decision, I told him most of what the catalog specifies and little more. A snip of his coment is here:
>I looked into Percom web site and noticed I could not sample the
>canadian data base. How can I know what I'm buying?...

I am fairly confident that PerCon values it's reputation and would not resort to false advertising. Rest assured that if the CD lacks in quality or content, or if the CD fails to contain the data PerCon promises, we will hear about it here from someone who bought the product and knows the facts.

Now Steve claims, " The downloadable IC data is a protected database. It does not contain police, consulate or military frequencies"!

*If it is 'protected', how is it Steve can access, download and evaluate the information and scope? Can you provide the FTP/Internet address?

*If you have indeed downloaded it, you will know that the database contains over 500,000 entries. If anyone can download it for free why would PerCon bother to offer the CD at all?

*How do you KNOW the PerCon Canada CD is missing 99% of PD frequencies?

*PerCon never said the database included Military frequencies and I never said it did either.

*I suspect that sdjones@bconnex.net has never seen this specific CD at all and has no real knowledge of the CD contents.

I deeply resent sdjones@bconnex.net and those like him who lack common manners, don't do their homework, don't know what they are talking and attack without knowing the facts.

Steve, it is clear that you lack a basic education because you are unable to express yourself without resorting to gutter language. For that and other offences, I publicly spank you.

3035. Optoelectronics announces new Xplorer!

Newsgroup: rec.radio.scanner
Date: 1996-05-08 00:00:00 UTC
From: opto@igc.net
Message-ID: <4mqmua$bk6@news.igc.net>
Source record: 234330

Optoelectronics announces the all new Xplorer test receiver. The Xplorer sweeps the range of 30MHz to 2GHz in less than one second. It automatically locks onto the strongest signal present in the nearfield (up to 1/4 mile away)and demodulates the audio through the internal speaker. On the two line LCD display it will display the frequency and either, signal strength, FM deviation, CTCSS, DCS, DTMF,or latitude and longitude. The Xplorer test receiver is basically three Optoelectronics products rolled into one. The Scout frequency recorder, R10 Interceptor nearfield receiver, and DC440 decoder.
Operation allows for manual skip, frequency lock out, auto or manual hold and frequency recording of 500 frequencies. The frequency recorder register can include such information as frequency, time, date, latitude, and longitude. The Xplorer has a serial data interface that provides for TTL and RS-232 format, as well as an NMEA-0183 interface for providing GPS latitude, longitude and altitude information.
This is the unit that so many Scout and R10 owners have been asking for. A unit that displays frequency and gives audio out at the same time, all on the same unit.
Factory Direct Orders are being taken right now. The introductry price is $899. The Xplorer is due to ship in 6 weeks.
Don't wait!!! Get your order in now.
Call 1-800-327-5912 or email us at opto@igc.net

Source record: 234331

All,

I'm very interested in monitoring Aviation on VHF, both voice and ACARS. My primary interest is in commercial aviation (airlines) and ATC. I'd be particularly interested in seeing ACARS datalink capture files from different areas, especially if you are able to receive ground based transmissions. Also I'd be very interested in VHF frequencies used and specific details regarding traffic flow and routings (I can e-mail a file from this area to give you an idea of what I'm looking for). If anyone is interested in exhanging this type of information, please e-mail to: 103016.1072@compuserve.com

: Digital Capabilities?

People who have scanners with 800 mhz will be able to pick up cellular
for a long time. Only a small minority of phones will have these new
digital systems. They are going to slowly phase the digital systems in,
not convert everyone overnight. Just think, if they were going to stop
you from picking up cell calls on your scanner they'd have to make
EVERYONE get a new cell phone overnight, right. This ain't gonna happen.

There are several assignments to different Dinsneys in Anaheim.
Hope this helps out. I'll be heading that way in July, around the 4th
holiday.

Last time I was there (last year) they gave me a hassle about taking
my HT into the park. Since I was there for more than a week, I just
simply put it in my pocket and wasn't bothered again.

Here are the freqs listed by Title on License:

Disneyland Corporation:

Question... are the mics in the fast food joints always keyed on so that
everything that is said is broadcast? I thought the employees would
have to key the mic first.

You will often hear the clerks make off color remarks about customers waiting in line. The real fun comes when you freak out one of the clerks by commenting on something they say about the previous customer... they start worrying that they might have said something that went out over the intercom to the customer... this has a chilling effect on the clerks. I have heard the clerks make comments about the staff at the fast food store as well... so, it is very interesting!

It's also fun tracking them down, because they're very low in power and not listed in most Scanner frequency directories.

The customers mic is always open when a car is present. The employee
has to push one of two button to talk. One for internal communications
and one to speak to the customer. They accomplished with different
PL Tones (CTCSS). The new "GM" style headsets have the option of
using VOX. The "GM" headset also have push to talk buttons on the
ear portion of the headset.

Bob.

>probably a logical explanation, there always is.

Highly doubtful it was GSM heard on your FM scanner.
Digital cellular systems use a complicated system of encoding and
modulating such that a normal FM scanner and other additional parts,
i.e. codec, will not decode anything.
GSM and the US TDMA are similar. CDMA adds the further complication
of spread spectrum. Highly sophisticated scanners would be needed to
monitor a digital system. A hacked digital phone may be the best
starting point.

First the modulation is not continuous, it is time sliced into 8 channel
slots, each channel gets 1/8 of the frame to transmit the digital bits,
and across 8 frames 40ms of coded speech is transmitted.
Second, the modulation is not FM, it is one of many variants of
amplitude+phase shift keying - in GSM it is Gaussian minimum shift
keying, the pattern of amplitude and phase is called a constellation..
Third, the digital information representing the codec speech is
encoded with error correcting bits and broken up and recombined
in a process called interleaving to minimize burst errors.

Given the above, the GSM scanner needs the abilities to monitor
a time slot, demodulate the GSM constellation, de-interleave, apply
error correction, and do the GSM vocoding for the conversion of speech.

I have the RS discone mounted in the attic with 30' of RG6U (75 ohm)
feeding an F connector outlet in the 2nd story bedroom.
Comparing it to the collapsible RS scanner antenna, it is better
at 800-900MHz for cellular but poorer at 50MHz for cordless.
I suspect the center element is the key to good 25-50MHz reception.
I have not experimented with adding one...hope someone has.

Not to mention the fact that most of the cell phones sold today are still
the older analog models. Reason? They're much cheaper! The phones you
get for a penny with activation are analog, not digital.

Speaking of RELM, the company that bought the commercial radio section of the old Regency corp, I've dealt once with RELM and was very satisfied.

Someone gave me an old clunky 4-channel rockbound Regency BTL-304 39 mhz mobile radio, and I was able to buy a manual and 50 mhz/6 meter conversion parts from RELM with a fast delivery time. Although the service manual was fairly expensive, the other parts were reasonable and delivery was quick.

(My friendly local tech who did the 39-to-52mhz conversion said it was very difficult to retune, BTW. But the conversion did work fairly well.)

I have a New AR8000, OptoLynx computer I/F, and ScanStar SW for Windows 3.1.

Configuration: AR8000, Expert mode, 9600 baud, Delimiters CR.

Optolynx: Local/Full Duplex mode, connected to COM2, and connected
to
AR8000 with ribbon cable

PC: 486 with COM1 connected to Mouse, COM2 connected to Optolynx.
No other serial devices.

I have tried everything I know to get the PC to communicate with the AR8000 but have had no luck. I can get my Scout 40 to reactune the AR through the 2.5 mm cable hookup. I can get the Scout software to download the captured frequencies from the Scout through one of the OptoLynx CI-V ports OK. But I can't get ScanStar to establish communications through the OptoLynx AR8000 port. I sent the OptoLynx to their service department but it checked out OK. I contacted ScanStar and they said the COM port configuration might be the problem? The problem is either with the AR or the PC COM2 port configuration. I would appreciate any input for anyone who has experience with this kind of equipment. Also, I live in San Jose CA and would like to have the AR checked out on another PC setup of any kind to help diagnose this problem. Any help would be appreciated.

Please response Email or this NewsGroup.

Go to radio shack and look at their large assortment of transmitters. You have a pretty big choice; cordless phones, 5 channel walkie talkies, remote control toys, etc. Take your pick.

Bob Parnass does a pretty good job in Monitoring Times. He usually focuses on top of the line models that are quite similar. A good place for specs-at-a-glance is the Grove catalog. They have a chart that shows all the features side by side.

One of the problems is that there are so many scanners and very few of them actually stand out in a crowd. I usually buy the base models that stand out, since I don't need more hand-helds. If you have specific questions about certain models there are many people here tah can help. I could provide you comparison info on most of the top of the line base and handheld units, but I can't keep track of all the others out there. I tend to stay away from Radio Shack scanners since I have been burned too many times on quality issues (good design - poor manufacturing quality).

Get the Grove ANT-9. It is actually the Diamond DJ-130 (?) it alrady has the
center element and is constructed much better. I have heard several complaints
about the RS dicone falling apart/breaking.

You can add a center element to the RS model but if I recall, some of the parts are
rare or you must modify common parts (re-tap threads etc.)

Here it is:

California Penal Code Section 636.5 Wrongful
Interception and Divulgence of Police Radio Communication.

Any person not authorized by the sender, who intercepts
any police radio service communications, by use of a
scanner or other means, for the purpose of using that
communication to assist in the commission of a criminal
offense or to avoid or escape arrest, trial, conviction,
or punishment or who divulges to any person he or she knows
to be a suspect in the commission of any criminal offense,
the existence, contents, substance, purport, effect or
meaning of that communication concerning escape from arrest,
trial, conviction, or punishment is guilty of a misdemeanor.
Nothing in this section shall preclude prosecution of any
person under section 31 or 32.
As used in this section "police radio service
communications" means a communications authorized by the
Federal Communications Commission to be transmitted by a
station in the police radio service. Leg.H. 1976 ch. 1129,
1991 ch. 515.

I just got rid of my Pro-2037 and got a Pro-2035 at a good price. Now
I'm looking into the Opto OS535 Board. I would like some info from
others who have used this.
1.) Is it hard to install? (I saw an article in U.S. Scanner News
But still don't know about "nibbling" the back out)
2.) How much is it?
3.) What are the computer requirements? (I have a 486/66MHz but
would like to use it on an older 386/20MHz. is this OK?)
4.) Does the Opto OS535 open up the Gaps in the 800 band?
5.) Does anybody install these? (or are they too expensive)
and last,

6.) What is the best program for the OS535?

Thanks in advance,

Flint

It is only illegal to manufacture and sell (As a manufacturer or importer)
cellular capable or easily modifiable scanners)

>>
>> Is modifying a scanner illegal?

Not if it is yours.

>>
>> Also, let's say I do have a modified scanner, and for some reason I got

The law as applied to cellular monitoring makes it illegal to listen, not
having the ability to listen. The possession of a cellular capable
scanner is not prohibited.

>>
>> My friend made many references to 'illegal' cable boxes, he said just

3067. FS: PRO-51 800Mhz Scanner

Newsgroup: rec.radio.scanner
Date: 1996-05-09 00:00:00 UTC
From: scan550759@aol.com
Message-ID: <4mu800$2ec@newsbf02.news.aol.com>
Source record: 234212

Hello.

I have a PRO-51 Handheld Scanner for sale. It is a brand new unit in the box.
Here are the specs/information on it:

- 200 channels
- 800 Mhz
- "Band-Search" for VHF-air, Marine, Fire, and Weather
- HyperScan with 50 channels/sec or 100 channels/sec
- Priority Mode
- Lockout Channels
- Backlight
- Keypad lock button
- Memory Backup
- Earphone jack, external power jack, charging jack, and BNC antenna jack.
- Rubber ducky antenna included.
- Takes 4 AA batteries.
- Can run off AC current or DC with appropriate adapters.
- Covers the following:
29-54, 108-174, 406-512, 806-823.9375, 851-868.9375, 896.1125-956 Mhz..

From the catalog: 6 1/6" tall, 2 7/16" wide, 1 11/16" thick

Retails for $319, I will take any REASONABLE offer.
At this time, I don't have a receipt, but that could change (I have to search
for it, which is why I'm selling on the 'Net..)

Terms: You pay shipping and/or COD charges, depending upon the offer.
I would be willing to open up the scanner before shipping to make sure
it's fully functional.

Please leave email with offers/information.
Thanks!

>Not to mention the fact that most of the cell phones sold today are still
>the older analog models. Reason? They're much cheaper! The phones you
>get for a penny with activation are analog, not digital.

Here in Portland, Oregon AT&T wireless (formerly Cellular One) has been
selling digital phones for 1 1/2 years, but because of customer
dissatisfaction they are not pushing the units as superior technology and
are not even giving commisions to their executive account reps for sales
of the digitals. They are offering current digital subscibers an exchange
to an analog, Yes, digital is here and the future is digital, but the
current digital systems leave much to be desired.
A friend who works at AT&T said that the majority of new digital system
subscibers are those who are concerned with message security. I wonder how
many of these subs are aware that most digital phones default to analog?

It's a transmitter that transmits on K-band, if you have a radar
detector with the new feature in it, it will give you two types of alerts
A) Road Hazard
B) Emergency Vehicle

The transmitter has two areas that it operates on and it's on the High
side of K-band. It also transmits a small code so Cop radars won't fool
the detector. The whole thing is pretty small, goes inside of a lightbar,
range ~2miles.

Yes, I had a feeling I might have been wrong. I was following
instructions in one of my many scanning books, and I searched around
1200Mhz (or somewhere like that in the 1000 range). I was using WFM,
and clearly made out words, and found there were 5 conversations.
Prehaps it was just an image of normal cellular :-? I don't claim to
know much about it, and am probably very wrong, so please don't send me
loads of technical info proving me wrong :-)

Seeya!

Vampyr (palomino@ritz.mordor.com) wrote:

: Is modifying a scanner illegal?

No. Companies such as Cellular Security Group in MA have been openly doing it, and running big ads in PC and MT about it, for years. All that is illegal is for a retailer to sell an easily modified receiver, or to actually USE the receiver to intercept private communications.

: Also, let's say I do have a modified scanner, and for some reason I got
: busted, would I be charged for listening to cellular just on the basis
: that my scanner can? the question that comes to my mind is how could the
: FCC prove I was listening?

No. Unless have gotten yourself into some trouble by your listening to cell calls. Like if you are getting busted for credit card fraud and they supected you got the numbers from cell phone users. Or are caught trying to blackmail someone with recordings of their phone calls.

IMO, you're being a little paranoid. The FCC can't prove you were listening, so they have no case against you. The situation with cable boxes is different, as some states have passed special laws regarding this. Such laws have nothing to do with scanners.

I have a web page (URL below) you can check out and
see if you can find it their. I'm not sure what
region Lake of Woods is in, maybe you can let me
know and I'll see how I can help.

I'm not aware of any new system for Niagara Region Fire departments
Is it possible their using Hamiltons system?

I have web pages for Ontario http://www.interlog.com/~ronkatz
check out the Niagara Region stuff I try and keep it up to date
but your giving me the feeling that Niagara has some new channel.
My current information can be found on that page.

If you find that in fact Niagara has changed then please let
me know.

Also seeing you are in the Niagara area if you have anything from
that area you think would be nice to add to the web page please
fell free to send it to me.

Talk to you soon.

Hi, netizen.
I'm looking for the driver of "DEST PCScan 1000" scanner.
A few days ago, my professor brought me scanner, but there wasn't
driver.
He said that it had used for Mac.
...
Oh, Isn't there anyone who have driver files or know from where I can
get it?
Please, let me Know it.

Thank for reading my poor English.

Most CB sets sold aren't LSB or USB equiped. Therefore only some 'CBers'
may operate SSB, most will transmit AM.

I have found this info for the cellular restore for the BC 890 xlt.
Does anyone have any experience to verify this info?
thanks
Harold

Subject: bc890xlt-800mhz full restore

1. remove all cabinet screws.
2. remove 4 face plate screws and 1 bracket screw at center of main board.
3. carefully depress the outside edges of faceplate shield and tilt down.
4. unplug j4 and j5 and ribbon connectors j501 j502 and j503.
5. remove faceplate and logic board.
6. position board so microprossoe chip is on left and memory battery on right.
7. locate the 3 chip resistors at chips upper right..marked 104 and
carefully desolder.
8. install the chip resistor at the 2 empty pads closest to memory battery.
9. reassemble carefully in reverse order.
10. test by entering freq. around 870 mhz.

steps 7 & 8 seem somewhat unclear, do you have any
additional info??

The only thing I can suggest is an active antenna ie one with a built in amplifier mounted as high as possible with a large ground plane (sheets of tin foil work quite well for this.) As air band transmissions are line of sight it may well be that no matter what you do, you wont get ground transmissions!

3098. AR8000 narrow filter mod

Newsgroup: rec.radio.scanner
Date: 1996-05-09 00:00:00 UTC
From: klimasewski@fccvde.enet.dec.com
Message-ID: <4mso8a$c50@mrnews.mro.dec.com>
Source record: 234290

I have designed a switching scheme that allows the user to select
the stock 12KHz AM filter or the narrow SSB 4.0KHz while still in
the AM mode. I have found this to make a BIG difference when trying
to receive a weak shortwave station next to a very strong one.
The only part required is a switch and some wire.
My mod has no effect on the use of the DS8000 speech inversion accessory.

Send me email if interested.

Ken

Source record: 234292

Brian Varine wrote:

There are two ways to do this..the first is to use a directional "yagi" antenna and simply point it in the direction of the strongest signal. The other is more costly and complicated. There are direction finding units on the market that use several antennas and measuer the delay in the received signal between antennas. Usually called "doppler" scanners, or doppler direction finders, or something similar, these units can usually give you an actual bearing to the target signal. I had a friend in University (elec. engineer) that built one himself. I wouldnt recommend that though...if you want to spend the $$$, I've seen ads for these types of equipment in Mobile Radio Technology magazine...

3101. Yorktown, VA - Coleman Bridge construction monitoring

Newsgroup: rec.radio.scanner
Date: 1996-05-09 00:00:00 UTC
From: jhalsey@freenet.vcu.edu
Message-ID: <4msoil$d20@freenet.vcu.edu>
Source record: 234293

Here is a brief synopsis of one person's scanning results concerning the re-building of the Coleman Bridge in Yorktown, VA. (Scheduled for completion by May 18, 1996)

Months earlier, I began my search for possible liason frequencies of the company and agencies involved in this two week disruption of US Route 17.

My first step was to look up the contractor's name in a frequency data-base CD-ROM produced by a company trading under the name of Mr. Scanner at the Virginia Beach Hamfest last year. NO SUCH LISTING. Of course!! (grumble grumble) Next, on to the NET so that I can surf the resources of Percom Corp. No luck there, either. RATS...! Next try; onto Police Call. Again, no such company listed. I even took the step of going to a Public Relations meeting, but that also turned up a big zero. I comtemplated going to the local FCC field office in Norfolk, but didn't really think they would help. (anyone know if they would or could help my search?)

Finally, the day before my afternoon visit to the construction site, I had to use the low tech method of punching in all itinerant frequencies listed in "Police Call & Beyond" into my RS Pro-39. Turns out, this method found the primary base frequency of TCC. Later, on-site, my RS frequency counter displayed the Coast Guard command post comms between them and an on-scene cutter. Couldn't get close enough to any handy-talkies to try for a frequency check. There was a USCG chopper on scene but I didn't detect any air-ground comms while I was there.

Here is what I did find concerning the world's second largest double draw span (according to the Virginia Department of Transportation, and Tidewater Construction Corporation, the primary contractor for the 73 million dollar project) project.

Frequency User Assigned useage

151.505 Mhz Tidewater Construction Corp. Itinerant
/ Coleman Base

43.100 Mhz UNKNOWN Itinerant

157.175 Mhz U.S. Coast Guard Command Post Marine VHF chl. 21

156.350 Mhz Moran Tugs Marine VHF chl. 07

I would be interested in hearing from others concerning local frequency determination. Also, would like to find out more about local radio call signs such as "watchdog", "beachcomber", "dragnet", or "giant killer" if anyone can help.

Selling as a set - will not part out.

Radio Shack Pro-2006 with Optoscan 456 computer Interface
(PC only) for sale. Includes DOS version of Scanstar Pro v3.44 and
interface cable. Manuals for both. Has cellular and speed up mods
done. Desktop model.

Radio Shack Pro-2028 Radio scanner. 50 channel. Desktop model.

DJ-130 Discone Scanner antenna with very high quality coax cable.

Radio Shack RF Frequency counter. Range 1 to 1300mhz. Handheld
model.

Above four items in very good/new condition.

Will include a AOR AR1000XLT handheld radio scanner, which has a
sticky keypad. Sometimes the keypad works and sometimes not.
With manual. Range 500khz to 1300mhz. Handheld model. Fair condition.

Plus a couple of misc. radio frequency guides/books.

Selling price for pickup at my home - $700. Firm. Cash or cashier check.

I'm also looking for Photo Studio Flash lighing equipment. Power packs, lights,
softboxes, light stands, barndoors, snoots, color filters, etc. Would consider a
trade for a nearly complete set of Studio Flash equipment. Used equipment in
very good condition is ok.

An amplifier could be used but it would not be legal. Legally, you could add tuned omni- or directional antennas to the base and handset. It would be quite awkward at the handset. Just one tuned, directional antenna at the base could do a lot for range - say... a 6 element yagi
:-)

Well, I'm not a lawyer, but this certainly doesn't sound like there's
any restriction on using a scanner in California for your own interest
and amusement. This statute seeems to only touch using a scanner to
assist either in committing a crime yourself or helping someone else
who has committed a crime.

Probably every state has a statute with language like this.

Don't know about Toronto, but there are a few retailers out on the
World Wide Web these days. The My issue of U.S. Scanner News lists a
number of sites.

Hi. I just bought my first scanner, a Uniden Sportscat SC150. I live in a pretty podunk town, with podunk towns all about, and this is the best scanner I could find in the area. How does it compare to others for price/performace etc?

Anyway, I've got the police/fire/med and some various other fun stuff like a few cordless phones programed in. I know there are a lot of truckers who pass through our valley, and was wondering if you can pick up CB radio conversations with these things.

Also, I think I've heard of boards that plug into your computer that function as a scanner, allowing computer control, and also some boards that will decode pager information. Can anybody provide me with prices or places to order from? Anywhere I can get information on the net?

Please reply via e-mail if it isn't too much trouble. I'll keep checking back in here. Thanx.

Geez, guys! Can't we just answer the question?!?!?

6 inches would put the resonant frequency around 468 MHz. 5.9 inches will put you in the center of that spread (475 MHz). You should obtain reasonable performance. Mount the antenna as close to the center of the roof as possible. Keep the coax as short as you can, signal loss is high at UHF frequencies.

Is it against the law to sell/import/export cellular tracking devices in/to
the USA (eg from Canada) or is it only unlawfull to possess and/or use such
a device within the USA?
Does anyone know the law regarding cell listening/tracking and equiptment sale?

Plus the 40-bit encryption, which could not be worked-out real-time,
and would have to be known.
However, is is currently being done by government, (try to get them
to admit that!) and the introduction os GSM into Australia was delayed
to allow the government to obtain such equiptment. (Which, incidently,
the carriers were forced to pay partial funding of the $35 million
needed, as part of the conditions of offering the service.)

So, it can be done, but if you could afford that sort of money, I'm
sure you would find better use of your time than listening in to
private phone calls!

Im in Toronto Canada I can do the mod I did it to my 2006

I have one switch in the front and one in the back of the
scanner. You can have a dial if you wish which is harder
to find or dip switches in the front under the display.

Its not easy to do and requires very carful soldering and
desoldering. Carful if you follow the Cheek mod its not
clear on what pins have to be soldered or removed etc. But
Cheek has the right idea.

True. Many mods are easily available on the WWW. Additionally, and probably a bit more reliable, is "Radio/Tech Modifications" by Artsci. Most scanner mods are in edition "A", and the current version is 8A. That covers Kenwood, Icom, RS Scanners, Uniden/Bearcat scanners, and regency scanners. Volume B handles all the rest of the amateur radio rigs.
It has good documentation, a tech support number, and the ability to request new mods from the company if you are a registered owner of the book(S).
The list cost is $19.95 each. Artsci's number is :(818)843-4080.

I purchased the RS Discone & added a vertical element to it. Go to a "Home Depot" or "Hechinger" and look for a 5/16 "rod coupler" . Get a tap for 3/8 24 thread & tap out half of the coupler for this thread. Remove the rubber boot and the nut on the top of the discone. Add the coupler & screw on the CB mobile antenna of your choice.

No government would ever listen to cell phones;-) Seems like it would be
easier to tap a wireline phone or bug the cell phone itself. Remember
when the Isreali's blew some dude up with his cell phone? The injected
noise into his signal so he brought it in to get fixed. Well, the Mossad
fixed it all right. Rrrrrring....*BOOOM* Seems like the govt could just
have you bring in your phone and bug it.

Anyone have any experience receiving INMARSAT? Its a portable satalite phone system which was used by CNN cooreспondants during the gulf war to get reports from Iraq. I beleive it is around 1500Mhz somewhere. I have read ads for dishes as well as loop yagis (Down East Microwave) that can pull it in. I think the downlink signal bandwidth is about 30-40Khz wide, like the GEOS weather satellites, so a modified scanner would be needed. Anyone try it with a unmodified scanner?

Stan

> I own a bc890 and it is a great scanner but I was wondering why there is
> never any talk about it on this group. It's the same as the bc9000 but
> only covers to 956MHz

Probably because apart from its nice looks, receiver performance is
only half-decent. I speak frm experience. I owned an 890 when they 1st
came out. The sleek looks and VFO knob were attracive to me but I sold
it within a couple of weeks and bought another PRO-2004.
The sensitivity and selectivity of the receiver did not compare to the
2004. Construction of the 890 internally (board quality, chassis) was
'chinsy'.
JFYI, I'm not so sure the 890 is just a 9000 without the extended
frequency capability. I believe the 9000 is a couple of steps up in
performance.

Not on your scanner. Those freqs (26.965 Mhz to 27.405 Mhz) are below the
usual scanner starting freq of 30 Mhz. You could pick up this range on
your shortwave radio, however.

Source record: 234176

Paul,

Thank you for your reply. I can appreciate that many things are different between Canada and the US, but cant' we be friends?

Back to issues. There is nothing (that I know of) other than global copyrights and pattents that prevent a publisher in the United Snakes from publishing frequency data banned in Canada.

'Sensitive' frequencies in both countries and other related data has been guarded for many years. While government publications and documents DO specify allocations, much/most of the 'sensitive' data is deleted when those documents are obtained thru the Freedom of Information Act.

Thankfully, all of the related communications equipment requires people to maintain it. This is the second best source of sensitive frequency listings. The first best source are those of us who love and pursue these fine collections. Over the years we have managed to amass a very clear picture of 'who lives where'. In fact, our data is so accurate, some agencies justified encrypiton equipment.

Fine publications like FEDERAL FREQUENCY ALLOCATIONS and TOP SECRET REGISTRY of US GOVERNMENT FREQUENCIES are two great examples of how complete the picture is! There is nothing to prevent similar efforts for the Canadian spectrum.

PerCon *may have the best collection possible, given Canadian restrictions, in the new CD, SPECTRUM ~ CANADA. Now I can't vouch for it's contents because I haven't seen it, however, I CAN now tell you that SPECTRUM ~ 96 (USA) is EVERYTHING PerCon promised and more! Within the next day or two, I plan to offer a full product review here. If you have been holding back, don't! Order yours today, it IS outstanding and well worth the $25+ price.

My real beef with Steve was his language and the speed he attacked the possibility that someone may have a list of protected Canadian frequencies. I am very confident Steve has not seen the CD at all and had no basis to attack information he didn't have. As I mentioned before, if PerCon fails to provide what it advertises within it's SPECTRUM ~ CANADA CD (police, fire, etc), I'm confident we will read about it here!

I suspect every serious scanner fan in Canada HAS the frequencies for his local cop shop or local RCMP effort and if he didn't, I dare tell you that he wasn't serious after all. I suspect too that computers have made list-sharing a reality. In fact, I have a list of

almost 200 RCMP 'sensitive' frequencies and I got them without trying! Don't ask for a copy as it is in book form on the last pages of TOP SECRET REGISTRY, mentioned above.

I suspect Steve regrets his post and let's all please agree to leave it at that.

Happy scanning!

Uncle T.

It's much like the cell-phone situation here. Banned or not, if anyone wants it, they can have cell-phone monitoring with little effort.

Flint (Flint@Orbiter.Com) wrote:

: I just got rid of my Pro-2037 and got a Pro-2035 at a good price. Now
: I'm looking into the Opto OS535 Board. I would like some info from
: others who have used this.
:1.) Is it hard to install? (I saw an article in U.S. Scanner News
: But still don't know about "nibbling" the back out)

No, it's actually fairly easy. If you take your time you'll have no problem.

:2.) How much is it?

$299

:3.) What are the computer requirements? (I have a 486/66MHz but
: would like to use it on an older 386/20MHz. is this OK?)

A 386/20 will be fine. With a 386SX16 running DOS 5, I was getting upwards
of 50 cps searching/scanning rate. Now, with a 386SX25 running Windows and
the Microsoft network, I'm still getting 30+ cps. Running it under Windows
slows it down, but not a whole lot. I even got good results with a 10 MHz XT.

:4.) Does the Opto OS535 open up the Gaps in the 800 band?

Only if you work for the government or a cellluar shop and can get the
unlock code.

:5.) Does anybody install these? (or are they too expensive)

I don't know. I *think* Grove will install for a modest fee.

:6.) What is the best program for the OS535?

I prefer Probe. It will run well on just about any IBM compatible
computer, even an old 4.77 MHz XT.

3144. Re: Some newbie questions - no laughing pleas

Newsgroup: rec.radio.scanner
Date: 1996-05-10 00:00:00 UTC
From: toledomug@aol.com
Message-ID: <4n0acs$l1e@newsbf02.news.aol.com>
Source record: 234182

The CB frequencies are in the 26-27 megahertz range. Most scanners can't get them, although a couple higher-end scanners can. A lot of times, it's actually cheaper to get a hand-held CD radio from Radio Shack then it is to buy a top-of-the-line scanner. You can get handheld CB's for around $100.

As far as computer control, the boards that are out there don't actually go into your computer, they go inside your scanner. Then you run a cable from the board to your computer, through your computer's parallel port. When you have a board inside your scanner, it completely takes control of your scanner. You use your computer to scan/search and everything else your scanner does. It's kinda like the computer just uses the recieving circuits from the scanner and the computer manipulates the frequency/volume, etc.

Hope this helps! Any other questions just ask!

I heard somewhere that the OS535, or any computer control board for that matter, takes control of the scanner away from the keypad on the scanner, so you can only control it with the computer. Is this true? And if so, can you still turn the board off or something so that if I take my scanner somewhere I don't have to lug my computer around to control it? I'm thinking about buying one, but I'm not too sure about these questions......

Thanks!

At 1200Mhz, it's very likely you were listening to images of normal cellular. It is very common for scanners which tune above 1Ghz to pick up cell images. There are very few real signals in this band to interfere with the images. Also, most of these scanners are triple-conversion which means their IF frequency will shift the images several hundred Mhz above the cell band.

Digital cellphones use the same frequencies as regular cellphones. They are able to carry more conversations on the same bandwidth, however. They are also totally impossible to listen to on a normal scanner.

Anthony O. Cardenas ~ WA6IGJ (doc@dxnet.com) wrote:

: Now Steve claims, " The downloadable IC data is a protected database.
: It does not contain police, consulate or military frequencies"!
:
: *If it is 'protected', how is it Steve can access, download and
: evaluate the information and scope? Can you provide the FTP/Internet
: address?

http://info.ic.gc.ca/ic-data/telecom/ALS-data.

You'll find 4 files (TAFL1-TAFL4.zip) from 4-6megs in size each.
Uncompressed they run about 20megs.

IC refers to this as the protected version of the database since it has had
the freqs. deemed sensitive removed. The unprotected version of the
database is for IC internal use only.

: *If you have indeed downloaded it, you will know that the database
: contains over 500,000 entries. If anyone can download it for free
: why would PerCon bother to offer the CD at all?

How many people want to devote a large chunk of their harddrive to a
database when they can have it on CD-ROM? How many people can write the
program necessary to convert the 2 line per record format over to a proper
database structure such as DBase that's easily searchable? How many people
can afford to tie up a phoneline to download 20megs of data? For many
people Percon has provided a solution. However, most people would assume
that the CD would contain all allocations including police. IC does not
release this info even under the Freedom of Information Act.

: *PerCon never said the database included Military frequencies and I
: never said it did either.

So??? I was just pointing out that the frequency list available from IC
does not contain PD, military or consulate freqs.

: Steve, it is clear that you lack a basic education because you are
: unable to express yourself without resorting to gutter language.

Compared to the ongoing flamewars my language was pretty tame.

: For that and other offences, I publicly spank you.

Sorry I'm not that type of guy. You'll have to look elsewhere for your fun.

Although they appear similar at a distance,
the BC890 and BC9000XLT are two *very* different models.
The BC9000XLT has a high 1st IF, much wider frequency
coverage, lots more features, and much better performance.

There have been several articles posted on the BC890 over the
years, but most were posted when this model first appeared.

From the FAQ, "Buying a Used Scanner:"

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning
knob. 200 channels, global delay. Count, AUX, and Auto
Store features. Scans and searches fast. Accepts optional
CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF
-- lots of images and birdies. Prone to severe intermod,
especially when used with an outdoor antenna. See "The
Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass,
in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using
up-conversion. 500 channels in twenty banks. Up to 250
channels can be programmed with alpha labels. Tuning knob.
Selectable AM, NFM, WFM modes. Optional CTCSS decoder.
Very fast scan and search. Can lock out 50 channels during
search. Delay and attenuator independently programmable
for each channel. Effective Auto Store feature stores
unique frequencies. Good RF section, but not as robust as
PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One
urban user, located within a couple of blocks of several
high power transmitters, reports severe desense problems.
See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S,
in Monitoring Times, March 1995.

As far as I know AFRTS uses standard broadcast frequencies in the host countries. They also have cable systems on base, and on-board ship.

Here's some AFRTS trivia that WILL blow your socks off: During Vietnam the "T" came to AFRS. The Air Force flew television transmitters in C-130's with a "drag wire" antenna. They would orbit on station and broadcast the TV shows.

That tidbit came from the program at a AFRTS BC Christmas Party in Los Angeles.

The Kenwood scanner has a MAIN and SUB indicator in the LCD display
but the manual don't tell of this. Any hidden features or functions
in the RZ-1 scanner. As far as I know the LCD display used in the RZ-1 is
not used in another Kenwood radio. What's going on here about the MAIN
and SUB? It's in the right hand corner of the display below the M. CH.

Any keyboard mods like some Kenwood transceiver have? Don't hear
much on this scanner.

I have a Radio Shack PRO-2006 that I am interested in selling.
The scanner is in EXCELLENT condition. I also need to sell a discone
scanner (RS #20-013) and about 40 feet of RG-8 cable. I have all the
manuals and even the original box for the scanner. I would like to
sell everything together.

I am looking to sell it for somewhere around $300

If you're interested make an offer to:

I purchased the same radio and software about 3 months ago and also had the same exact problems. I had a friend hook the radio up to another brand of software and everything worked fine. I contacted the software co. and they proceeded to tell me that the radio is a piece of junk, but if I would send it to them they would modify it to make it work. After several telephone calls and he keep comeing up with the same answer I told him that I was returning the software for a full refund and he just said, Do what you gotta do.... Needless to say, he never sent a credit to american express and I had returned it insured with a return receipt, but still didn't want to credit my account. I contacted amer. express and told them of the problem and faxed the return docs to them and they gave me a full refund and then went after them to recoop their money. I had a letter from am ex saying that it had been resolved.
The radio is working great after useing other software. Hope this will help to save others from the same problem.
Joe

You get 4 settings via the "dial". I haven't tried it on cordless (really), but it does work on the Ca DOJ. The only annoying thing is the PL tone gets inverted to audible. I think the board should of had more high pass filtering before the inverter.

The installation is trivial. Sure, it costs more than a Ramsey, but then again it is "well integrated" with the scanner.

The DS8000 board has the markings erased off the inverter chip. If anybody wants to trash one, I'm more than willing to open one up and get the manufacturers name and ID.

Hi Graham,
I am listening to 20M on a 9600 as I type this. Ham Radio had an up converter article back in 1985 I believe. It is a no holes mod as I built it making use of the spare SO239 knockout on the rear panel. With the mod the radio tunes 100 KHz- 60 Mhz in addition to 60-900 as previous. To tune 14 MHz for example, you enter 114.000 (100 + freq). Radio is really great w/ this converter. Also have the video card which is handy for DXing TV.

Hi Curtis, I can probably clarify some information about the power output for ATC/Ground Control/ ATIS since I'm a ground radio technician (15 years) for the air force. We use the Rivot Switch radios, (GRT-21,23) and (GRR-22,24) the same ones the FAA uses for the commercial airports. The transmitter puts out 10 watts and the power Amplifier puts out 50 watts. Some bases I've been at only use the transmitter (10 Watts) for ATIS because it is keyed all the time. These radios are designed for a continous duty cycle but we found this was vey hard on the amplifiers. With the antennas we use a typical range is upward to 200 miles to an aircraft however as you pointed out the range on land will be greatly reduced.

I should have said that I was searching 950-960Mhz. I didn't have the
freqs at hand. I'm sure I'm wrong, after all the reading up I've done
about GSM. I must have been listening to a different phone network
around the same freqs :-/ I've only had a few troubles with the Ar8000
giving images, mainly those in the 70/80Mhz area of WFM radio.

> Digital cellphones use the same frequencies as regular cellphones. They

I'll agree there. Very strange indeed. Today I tried the exact same
thing I thought I had done, and there was nothing. Never mind...

Do you have anyother channels in that bank. You must have at least
channel in each bank that is not locked out. To test this unlock one of
the channels in that bank and then try to lock out that one (240).
Good luck and happy scanning

I have a close friend looking for a 800 MHz capable scanner. It does NOT have to be cellular modifiable. He received one capable of 512 MHz but can't get local police. He would like to take his back and apply those monies to a real scanner. He would like to not pay any more than absolutely necessary (duh). Preference would be give to central Illinois but hey I bought my mom one from here a year ago from Washington.

thanks
fred

The OS535 in conjunction with a computer and the software of your choice _does_ disable the the keypad function of the scanner. However, when not hooked to your computer, the scanner's front keypad controls are restored.

I got the OS535 from Grove and their catalog stated that no soldering is required for installation. Be advised that the OS535 _does_ require soldering for installation. At least mine did.

I have an Uniden BC 200XLT bought in Sweden.
It covers the following frequensies: 66-88,118-174,
406-512,806-956 MHz.
Now i wonder if it can be modyfied to cover the 30-50 MHz band?

>to allow the government to obtain such equiptment. (Which, incidently,
>the carriers were forced to pay partial funding of the $35 million
>needed, as part of the conditions of offering the service.)

One rather obvious point seems to have been overlooked here:

Every GSM phone and every GSM network has the ability to both encrypt and decrypt the GSM data. If it didn't, it wouldn't work! How else would you be able to hear what was being said when you used your GSM phone if the phone couldn't decrypt the incoming data?

This being the case, how on earth can other equipment designed for eavesdropping on a GSM call cost $35M!!! ? This doesn't make sense to me at all.

One can take a GSM phone to a totally foreign network, where that phone and SIM card are unknown and, provided there's a roaming agreement, the phone will work just fine without the network previously knowing anything about that phone like a serial number, IMEI etc.

My point is simply that whatever info is needed MUST be transmitted by the phone.

There must be thousands of people around the world who are involved deeply enough in GSM product development to know how to do it. It's only a matter of time before GSM security becomes almost worthless and one will be able to buy the equipment needed at a pretty reasonable price.

Well, the cheapest one's I have seen advertised in this group have been RS
and Bearcat scanners. But for under $100 I wouldn't expect to get an
800MHz scanner, let alone a cell modable one! $150+ maybe.

Good luck though! If you can prove me wrong, let me know!

In Cheek's _Ultimate Scanner III_ book, pg. 99, describes the mod to add 16000 channels to the Pro2035. It's seven pages long and explained in detail w/diagrams. Best bet is to buy the book from your favorite radio bookseller to get all the details.

If you live in the New England area and are interested in the
technology of scanning, come and join our new mailing list!

New England Scanner Technology

Here is where you'll find people taling about equipment,
gadgets, and accessories related to Scanning. No chatter
about groovy things heard on the McDonald's drive through! :)
We'll keep the regional stuff on regional lists.

To subscribe to this list, send a message like this:
To: nest-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe

The list is available in digested form too. It's address is:
To: nest-digest-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe
Digests go out once a week, early Monday morning.
- -

If you're interested in scanning but not in the technoid side
of it, you can join the localized mailing lists we have.
This list is meant as a regional alternative to the "scan-l"
mailing list which is nationwide.

scan-mass-east

This list covers all of Eastern Mass from West
of Worcester to the East right to the water.

To subscribe to the list, send a message like this:
To: scan-mass-east-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe

The list is available in digested form too. It's address is:
To: scan-mass-east-digest-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe
Digests currently go out about every two days.
- -

If you have direct WWW access, you can get on (or off) of the
lists via the simple interface at:

http://www.netspace.org/cgi-bin/lwgate/nest/
http://www.netspace.org/cgi-bin/lwgate/scan-mass-east/
or for the digested versions:
http://www.netspace.org/cgi-bin/lwgate/nest-digest/
http://www.netspace.org/cgi-bin/lwgate/scan-mass-east-digest/
depending on which list you're interested in.
- -

Tell your friends and spread the word!

Yes, Jim. The Board only takes control away from the keypad when
activated by your computer program. The Pro2035 or 2042 will still be
able to work without computer control. I have two OS 456's and that is
how OPTO has made them work.

You might want to study how "public key" encryption works. If you have a copy of PGP, the encryption program, you can intercept other people's messages but you can't decode them. Even though you've already intercepted their public keys. Same thing with the phones. You can listen to EVERYTHING which goes over the air and still not know enough to break the code.

I am selling my Uniden/Bearcat 350A for $100.00 (includes shipping). It goes from 30 to 512 MHz. It is in excelent condition. The following is a list of features:

* Instant Weather
* 30 -512 MHz
* Turbo Scan
* Lock Out
* BNC Antenna
* AC Cord
* Pre-Progrmammed Police, Fire, EMS, Air, and Marine
* 50 Channels
* 11 Band Search
* Owner's Manual
* Vehicle Mounting Kit
* EXCELLENT CONDITION!

If you have any questions or would like to purchuse it email (do not post) at:

bubba@shasta.com

In most of the network feeds we use a local vendor to provide the ht's this being either a local radio rental facility, the affiliate station or uplink provider. Rarely have I ever worked with a production that travels with anything more than a cellular.

No, but you may be wrong.

Please show me proof of your assertion. If you are as familiar with
constitutional law as you claim, you know that the proof is in the case law.

So start citing US Supreme Court decisions that support your position,
or shut up.

BTW, I HAVE taken college courses in constitutional law as a Criminal
Justice major.

Why don't you contact the local CAP unit? They will likely be more
than willing to talk to you.

FYI, Civil Air Patrol is not a military organization. They are
civilian volunteers and not all are aviators. They have radio experts,
medical teams, and ground search groups. There is an 800 number that
you should be able to get information about where there is a unit
nearby. Virtually every Air Force base has one, so call the base
public affairs office if you are near one.

That scanner will not hook up to a computer although there are many that will.
I have a AOR-2500 and its a pain in the ass to use with the computer. Heck its a pain in the ass to use without the computer! If you want a real good scanner try one of therse:

Radio Shack Pro-43, Pro-2006
Uniden BC-200xlt, BC-800xlt

These are good starter scanners and pretty easy to program
After you get tired of them them move on to the best:

AOR-8000 <wish I had one>

> Please reply via e-mail if it isn't too much trouble. I'll keep

Since the CAP operates as an auxilary of the Air Force, you may find it
difficult to locate "license" information. When I was in the Air Force
we didn't have licenses for operations in military bands. The FCC
doesn't coordinate the use of those. If the CAP is operating on aircraft
or other non-military bands, you might be able to find record of those.

> others who have used this.
> 1.) Is it hard to install? (I saw an article in U.S. Scanner News
> But still don't know about "nibbling" the back out)

It's not too awful hard to install. You will need a soldering iron / solder, phillips screw driver and a bit of technical knowledge. The OS535, comes with installation instructions and a template for "nibbling" out the back of the 2035. The nibbling tool can be found at Radio Shack.

> 2.) How much is it?

If your refering to the OS535, Optoelectronics April 1996 price list indicates the unit for $249.00 + S/H.

> 3.) What are the computer requirements? (I have a 486/66MHz but
> would like to use it on an older 386/20MHz. is this OK?)

You'll need an open serial port for sure. I am running Scan Star Plus for Windows. Originally I had only 4 meg ram running Win 3.1 with Scan Star and found out very quickly that the recommended 8 meg is almost a must. I have a computer set up just for the purpose of this application (Scanning) which is a 486Dx2-66MHz.

> 4.) Does the Opto OS535 open up the Gaps in the 800 band?

Not without the password and the scanning software that supports opening up the cell freq's. I originally was running Scan Star Commerical Edition for DOS until learning of this possibility, thus I upgraded to Scan Star Plus for Windows which supports the PW function. I understand that other scanning programs support this as well, just not sure who does and who doesn't.

> 5.) Does anybody install these? (or are they too expensive)

I believe GROVE sells and installs the OS535, but this I am not 100% sure of since I did my own installation.

> 6.) What is the best program for the OS535?
> I've not tested all the different programs so I'm in no position to judge, however I will say that I have been well pleased with the folks at Signal Intelligence with their products. (Scan Star Commerical and Scan Star Plus for Windows). I have had to call upon Technical Support once, and was happy with the responds.

Your welcome and I hope this helps.

Shane

>anymore, and I even loose plane transmission when they are in final.

Not surpising at 15 miles. Ground control is usually pretty low power
because the frequencies are reused more often. ATIS is usually a lower
power.

On the ground at 15 miles it's gonna be tougher. You need to remember
that ATC transmitters don't need low radiation angles since anything they
communicate with (that isn't at the airport) is probably flying.

And losing planes on final is probabaly expected too. Most planes don't
run more than about 10 watts. And they don't add much gain with their
antennas - again when your flying you don't need much gain, and you don;t
want huge antennas sticking out of your plane anyway.

>I am not a scanner/antenna guru.
>
>So what kind of antenna I need ?
>Will I will be able to listen to ground control transmission again ?

A roof mounted groundplane antenna would plane antenna would likely help.
You can get a 1/4 wave vertical VHF antenna with lowered ground radial
pretty cheap - heck you could make one.

If you are dead set on hearing things at that airport, you could try a
yagi. If you don't go with more than three elements, you could probabaly
get enough gain toward the airport without sacrificing too much on the
back side (and still be able to hear most airborne traffic from the other
direction).

>I would like to be able to put the antenna into the roof (not on...),
>I know it's not the best, but it's a brand new house and I do not feel
>like drilling holes in the roof yet... :-)

Well you could try the attic. I have done that in my townhouse with all
of my antennas (TV, VHF/UHF ham, scanner). The yagi might be a good
choice for the attic.

But you could mount a lightweight vertical to a roof vent pipe and run the cable to a gable vent or something. The only outdoor antenna I ever had on my townhouse was mast mounted to the railing of a balcony and real close to the roof. I brought the cable out of one of the attic vents under the roof eave.

Use care when selecting a coax than will make long horizontal runs outdoors. In addition to having the jacket on cheap breakdown in UV, many diecltrics will deform after a while. They won't support the weight of center conductor over along period of time in a horizontal run - especially when they get hot (like on your roof in the summer). When this happens the center conductor can get off center, changing the characteristic of the cable.

Well, if there is really a 40 bit key used for encryption, you would have
a hell of a time trying to decrypt transmissions even with a hacked GSM
phone. Decryption is not complicated with the key known, but virtually
impossible with it unknown!

If the phones do indeed tx this key, it is kind of a waste to have it
(especially 40 bits)! It would make more sense that the key is known to
both the system and the phone. If you roam, the "foreign" system will most

likely have a way to get info from your own system (phone #, acct. #, encryption key, etc.) before it allows you to use it. Afterall, they have to know how to bill you for your air time!

>Now i wonder if it can be modyfied to cover the 30-50 MHz band?

If you get a copy of the service manual, you can probably find out how difficult it would be. The RF circuitry would have to be retuned and/or component values changed, as well as changing the diode/resistor configuration to tell the microcontroller to access that band. The service manuals usually have schematics for both the European and American versions.

I have a RS PRO-50 & service manual which shows the differences in the component values in the RF section, and the diode configuration for the European and American versions.

Try Uniden customer service to order a service manual for it.

Not so, in GSM the "Keys" and user ID are never transmitted. But even if it was there are ways to beat anyone intecepting your transmission and successfully, Public Key Cryptology is very secure (Though not used by GSM) and don't forget, the GSM source code has never been released so you have to figure out the code structure first. GSM uses an elaborate scheme of challenge and replies to get it's encryption going.

>
> There must be thousands of people around the world who are involved
> deeply enough in GSM product development to know how to do it. It's only
> a matter of time before GSM security becomes almost worthless and one
> will be able to buy the equipment needed at a pretty reasonable price.

Not in the near future. Your best bet would be to parralel 40 or 50 computers to brute force hack the GSM code, since it's only 40 bits this could be done in less that a day (But still not real time). GSM is a very

sophisticated encryption method that uses a whole bunch of different algorythms(A5/A8, etc). It was designed in the 80's so they developed ways to prevent cloning and eavesdropping. As for thousands of people knowing about GSM don't bet on it. GSM was developed by the Brits and they make any country/company using it sign a Non-Disclosure agreement and get special licenses.

With the US so paranoid about secure communications for it's people it doesn't surprise me that the US decided not to adopt GSM. I've heard PCS will use it but the cell phone industry is still trying hard to get TDMA/CDMA to work.

I could get very technical, but what good what that be!
Listning to digital is one thing, cracking the encryption is quite
another.

Happy scanning,

Rickard.

Often the approach transmition sites are a long way from the airport, so
you cannot hear them without high elevation or a good antenna. You hear
the aircarft due to their altitude.

This should not be possible. GSM communication is digital and time multiplexed
and an analogue scanner is of no use. Unless prohibited (like in France)
the signals are also encrypted. What you heard was probably either cross-
modulation from analogue cellular phones or cordless phones. I don't
know about UK, but here in Denmark the are allocated space for cordless
phones just adjacent to the GSM band.

-=> Quoting Hugh Duff to All <=-

HD> You just have to keep an eye on the "busy" or "frequency in use"
HD> light on the radio so that you do not interfere with other users.
Huh? Nah. Actually, in a properly installed system, you will hear
ALL traffic within range when you take the microphone off hook. Automatically.

No need to watch the busy light.

Now, we are installing systems with "Busy channel lockout, no monitor"
that disables the transmitter if there is a signal on the channel
without the same PL as you have. Then it will beep at you if you try
to transmit while the channel is in use. Again, no need to look for the
light.

3242. Olympic Torch Relay freq

Newsgroup: rec.radio.scanner
Date: 1996-05-12 00:00:00 UTC
From: glm@xmission.com
Message-ID: <4n3d9e$5po@news.xmission.com>
Source record: 234054
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Yesterday, my family and I watched the Olympic Torch relay as it passed thru SLC. We saw it twice, as it turned out. We went way up ahead of it and watched it again.

An Oregon scanner nut, Minor Cross, seached out the freq for "Caravan Control" when the torch passed through Oregon and passed it on to some RCMA members. I thought some of you may be interested in listening in if it passes through your area . The freq is 469.3625

Torch 5 and Torch 6 are BMWs painted in Georga State Patrol colors. Sharp looking cars! It's worth it just to see them.

When I first started listening, there was some radio problems with Channel 1 (don't know it) so the Command told everyone to remain on Channel 2 (469.3625) for the remainder of the day.

Caravan Control asked Command if "Peacock 1 and 2" were still going to carry the torch. Command said. "Is that Stockton and Malone?" As any NBA or Utah Jazz fan knows, he was referring to John Stockton and Karl Malone. Don't know why they had code names, but it is funny how often security is breached on the radio. Even the newspaper said they would be torch bearers. Since the Jazz lost Thursday night, both declined to be run. The final leg was run by former Jazz player, Mark Eaton.

Another funny thing, the Pace Car asked Caravan Control their location. Caravan Control said, "Utah." There was about 30 seconds of silence, I imagine for some laughter. I know I was laughing.

If it comes thru your town, don't miss it. It's a pretty short parade, but a great scanner opportunity.

Thanks to Minor Cross for his great catch!

Steve and others:

Here is a copy of your post:

>What a load of shit!! The downloadable IC data is a protected database.
>It does not contain police, consulate or military frequencies. IC deems
>these 'secret'. The odd frequency has slipped through due to a slipup on
>the licensing application but 99% of all police frequencies are missing.

>I'm sure most people would regret buying a product that doesn't live up to
>it's claims.

>Steve

My two prime objections are that Steve's language is inappropriate and clearly shows his lack of education, self-control and respect for others.

Second, Steve attacks PerCons' product and it is now clear that he has not seen the CD at all. Steve can't tell you what color it is, how may actual protected entries ARE included or what is data is specifically missing.

Steve states the data is 'protected' and that the source for Canadian frequencies omits 99% of police frequencies and thus implies that PerCon's data base must also lack 99% of the frequencies.

Steve's final comment is, "I'm sure most people would regret buying a product that doesn't live up to it's claims". We would all agree with Steve's statment, however, as stated, Steve's statement unfairly casts a negative cloud over PerCon's product and I strongly object.

I received PerCon's SPECTRUM 96' CD (US Frequency Data Base) two days ago and I am very impressed with the overall quality of this fine CD. The CD is everything PerCon promised and a little more. There were two nice features PerCon didn't mention. I highly recommend this CD to everyone.

How CD's save hard drive space or that CD media offers a easy transportable method for quantity media storage was never at issue. From Steve's message, one could easily beleive that PerCon's Canadian data can be downloaded from the Internet:
>...The downloadable IC data is a protected database.
>It does not contain police, consulate or military frequencies....
My comment was:
*If you have indeed downloaded it, you will know that the database

*contains over 500,000 entries. If anyone can download it for free
*why would PerCon bother to offer the CD at all?

Steve would muddle issues with other diatribe and even offer a
Internet site he knows offers "99%" of 'desired data' missing.
Not once did he apologise for his language or misrepresentations.
Steve's posture says everything about his credibility, or lack of it.
At this point I have nothing more to say to or about him.

To clear the record, I am not a employee of PerCon. I do, however,
fully support PerCons efforts to set the records straight. I hope to
have a review of the new SPECTRUM 96' CD out tonight.

I apologize to everyone (myself excepted) for taking such issue with
Steve's posts. I feel that information here should be as accurate and
truthfull as possible. While we will, on occasion, make mistakes and
offer information we thought was gospel, thankfully, there are those
who will offer truth. That's why I'm here.

Respectfully,
Anthony Cardenas

Hello All:

Here's a question for some of the 'older' scanner people, and forgive me if this isn't the right group to post to, but it seemed natural...

Does anyone remember what frequency the first satellite, Sputnik transmitted on? I would think it would be somewhere in the "VHF" area, perhaps between 100 mhz and maybe 200 mhz, this guess based on the year it was launched and the technology used at that time, and, I also believe, having help from the early amateur radio pioneers.

Any guesses as to the freq???

TIA,

Jeff

Funny thing you should mention that. I wrote Opto's research and product development department about a year ago, suggesting an improvement on the scout, having the unit automatically SAVE frequencies when turning it off (instead of deleting them). I suggested a way to do the "improvement" in my letter but I never got so much as a "thank you for your input" back from them. Lo and behold, the latest models of their SCOUT have this very same feature I suggested.

Makes you wonder, hey???

3248. SPECTRUM 96' CD ~ A Review

Newsgroup: rec.radio.scanner
Date: 1996-05-12 00:00:00 UTC
From: doc@dxnet.com
Message-ID: <31954969.5292023@news.dxnet.com>
Source record: 234060

Friends,

There has been much excitement about PerCons' new CD, SPECTRUM 96' for Windows, DOS and MAC, and rightfully so! I am very pleased to report that 96' is everything PerCon promised and a little more. If you had any hesitations, please don't delay any longer, order your copy today.

PerCon's frequency database includes 3,000,000 FCC records. 96' offers many search modes too. One can search by city, county and state. Search by frequency or city or service. Search by frequency blocks or request by latitude and longitude! Enter just a few digits of longitude and latitude and the PerCon's search engine will tell you all licenses within that block on all bands!

Name a company (or service) , state and/or city and 96' will tell you every license, with details, held by that entity. Specify a frequency in a city, county or state and see all stations licensed there. What broadcast studio news links are licensed in your city in the range of 450~455MHz? A few keystrokes and you will know. Search by callsign or licensee/business name. Each report includes type of service, city, number of mobiles and bases and more!

It is also important to understand that 3,000,000 records are interrogated. Some searches seem quicker than others. I have a 2X CD Drive and no search has taken more than three minuets, a reasonable amount of time considering everything taking place in the background.

Services not included are Federal Services (darn), military and Ham Radio licenses. Those are all I can think of.

One other minor point is that the user first selects all of the parameters for his search. Press enter. Each time before a search begins, the program halts and asks what you want to DO with the data before the results are posted. The options include display modes, printer or export to database. I would prefer a box or 'pull-down' options AFTER a search is completed and the data is evaluated. These are minor points, I know, but valid ones none the less.

It appears that you can 'open' the 96' search engine to OptoScan outputs and 96' will show print licensees on the frequency the OptoScan detects? Please don't hold me to this as I don't own a OptoScan and was not able to verify/test everything 96' offers in OptoScan support.

If I had a wish list for SPECTRUM 97', 97' would include the missing Federal and military services and a method to print one screen or one

license string from a search result list of many.

In conclusion, considering the reasonable $24.00+ price tag, SPECTRUM 96' is worth every dime. Many paperback publications in that price range can't include all of the data SPECTRUM 96' does and they can't offer the powerfull search/display and print options either. I am very pleased to recommend this fine product to you.

P.S. Please don't ask me to do personal search requests for you. The pay is much too low and I will not reply to such requests.

Respectfully submitted,

Tony Cardenas

There usedta be a Web page about this, but I couldn't find it tonite. I think AMSAT had it... As I recall it said that Sputnik was somewhere around 20-29 MHz. The page included a recording of the signal. A thin plaintive peeep peeep peeep with both amplitude and frequency modulation. Some of this modulation was caused by the tumbling of the satellite.
Hope this helps

Jim,

With the OS535 installed in a Radio Shack PRO-2035 the only time the
computer is in "control" of the scanner or scanning is when the
scanning software on the PC is active. Else the scanner is it old self.

Shane

: > 4.) Does the Opto OS535 open up the Gaps in the 800 band?

: Not without the password and the scanning software that supports opening
: up the cell freq's. I originally was running Scan Star Commerical
: Edition for DOS until learning of this possibility, thus I upgraded to
: Scan Star Plus for Windows which supports the PW function. I understand
: that other scanning programs support this as well, just not sure who
: does and who doesn't.

The password is published in the April 1996 issue of MT. We're supposed to believe that some hacker discovered it. The cynic in me, however, wants to believe that it was deliberately leaked. But by whom, that's the big question. Optoelectronics? ScanStar or Scancat? Radio Shack, after finding out their unmodifiable 2035 and 2042 aren't selling that well? All three of these stand to profit.

Does anyone know how the password was discovered? Also, is this something the FCC is going to crack down on? I don't believe that adding a $300 add-on board falls under the heading of what they define as an "easy" mod.

Hi 8K folk,

Does anybody know where discriminator output in AR-8000 is located ?
I have found 5 connectors on PCB. And I heared that discriminator
output is located on one of them.
Need diagram or detaild explanation how to find it(output).

Thanks in advance.
Best regards.

I get your point and I agree with you, however, the necessary private
key used has to be known to a whole bunch of people in the GSM industry
in order to design the phones and base station equipment and therefore
it surprises me that it hasn't leaked out more than it already has.

Just to give input on the used prices of 2006s...
I have been watching for one over the winter but didn't want to pay the 350-400 most people were asking. I kind of gave up on the search a few months ago. Well, last weekend I was at my local HRO store, and while I was there a guy came in to buy a dual band ht...he wanted to trade in a scanner towards it. I didn't pay much attention, but after several people had played with it, my wife went to look at it...she came over to me and said "Hey Gerry, isn't that the model you were watching for"? I strolled over and sure enough it was a mint PRO 2006. I asked how much and found out it could be mine for $225! (needless to say it is next to me now, informing me of local goings-on). I think this was a very good price, and I was in the right place at the right time. Good luck!

How come when I connect a cable from the line jack to the mic jack on my tape recorder, and then a cable from the RCA jack (aux) on the back to the REM jack on the tape recorder I basically get nothing.

I selected the channels I want to record and the record light flashes over the PL Tone.

When I disconnect the AUX cable, and split the external speaker output with the mic cable from the line jack, it records everything fine.

When I go back to using the AUX cable, I get nothing???

Please e-mail me your reply and it is much appreciated.

Thanks,
Jeff M.

From what I understand, it is not public safety and law enforcement
putting the push on to move to 800 mhz. but the FCC is the one making
the push. My understanding is the the FCC is wanting to free up some of
the existing frequencies now being used by law enforcement. Some
agencies are spending the money or obtaining grant funds to make the
move - others are resisting the change. I think overall we can thank
Uncle Sam for the push!

No. The majority of scanners do not have circuitry which can receive wide-band FM. Even if you modified the radio to tune these freqs, it wouldn't work. Fortunately, you won't have too much trouble finding a receiver to pick up what you're looking for.

I read somewhere that the Russians have used the same frequency since the Sputnik launch, and still use it to this day, but can't remember what it is or where I read it.

Geez, I wasn't even even born when Sputnik went up, but even I know
that it broadcast on the MW band! & The specific 'frequency planning' by the
Ruskies had a primary intention of making the Sputnik signal audible
directly by Americans on their home & car radios, for PR reasons.

Theres another freq as well

"Caravan Control" on 469.3625 and
"PI FI 1" and "PI FI 2" on 469.5000.

There used to be a product called "SW2" decoder for the Commodore 64 which would receive slow morse and "very slow", (max 300 baud) radio modem signals and display them as ASCII text on a television monitor. I still have one of these, however, as I say, the speed is not up to today's high speed transmissions. I managed to modify this device and the control software to allow it to goto 2400 baud reliably which allowed me to see many of the Southern CA./ Orange County Police transmissions for awhile. They now run much faster baud rates and are using SNA packet transmission. I don't live there anymore anyway so it's a mute issue...

I am also looking for a PC based device which could provide this and much more functionality. Since I haven't seen anything like this available commercially I think I might just build one. Does anyone think this might be a marketable item?!

Thanks for the input....

Mike -

Frequencies for the Thunderbirds are:
141.85 143.85 140.0 236.6 236.55
273.5 283.5 295.7 322.3 322.6

there are more but on two previous occasions I have listened to them on 141.85

But, if I take "parts" (an un-modified scanner), perform a "manufacturing process" on it (open it up, move a jumper, cut a lead, etc), then haven't I "manufactured" a cellular capable scanner and therefore broken the law? In other areas of federal law (e.g. firearms) modifying an existing unit is clearly considered "manufacturing". Does the law or regulation specifically address the issue of manufacture vs. modification for scanners? And can you prove that the "modification"/manufacture was performed prior to the enactment of the law?

Hi Kim,

* Try to connect a modem to your com port (COM2) then using the terminal
application (comes with Windows) try to type AT then press ENTER you
should get a OK answer. don't forget to configure the terminal
application to use COM2.

if you pass this test then you know that COM2 works well under Windows
on your system.

* Next try to connect your AOR8K to the PC again. Set the terminal
application to 9600bps. Make sure the AOR 8K is also configured at
9600bps. Press ENTER a few times. The scanner should display "REMOTE"

If you pass the second test then the communication between your PC and your scanner is OK.

If not:

* try again after switching between CR and CR & LF options on the scanner
* try a different COM port (com1)
* make sure the flat cable connected to the scanner is not up side down.

Since I don't use the OptoLynx AR8000 port nor ScanStar I can't help you with that.

If all fails you could come visit me at work (Cupertino, next to Apple) and we could test your scanner on my PC.

Haim

> transmitions.

You may get a more technical explanation from someone else, but basically the high speed tone bursts you refer to are computer data bursts used as part of the computer aided dispatch system. The data includes such information as the individual unit's identifier and authorization (so that it is recognized as an authorized user which is logged onto the system). Everytime a radio that is part of the system transmits, it automatically sends this "signature."

I am not too familiar with LAPD's system, but you will find the same kind of tone bursts in most every computerized dispatch system. Many systems use non- voice status indicators: the field unit simply presses a button to transmit a signal to the system updating the unit status (enroute, on scene, AOR, AIQ, etc). Many systems, especially trunked (800MHz) systems, have one or more frequencies on which only computer data is transmitted (the radio equivalent of a dedicated modem line) which keeps the computers in the field constatntly updated.

Hope this helps!

>Every GSM phone and every GSM network has the ability to both encrypt
>and decrypt the GSM data. If it didn't, it wouldn't work! How else would
>you be able to hear what was being said when you used your GSM phone if
>the phone couldn't decrypt the incoming data?

I believe you are confusing encryption/decrpytion with
modulation/demodulation. A GSM phone just converts the analog voice
to digital output and converts the digital input to analog output
which you can hear. While GSM could very well be made to decrypt and
encrypt its outputs/inputs, there is presently no reason to do so. A
scanner user can not make sense out of the digital data the a GSM
phone outputs - but not because it is encrypted ut simply because it
is digital. Scanners are designed to listen to analog signals; ie:
normal voice.

One very neat and interesting thing about GSM or digital phone
technoloty is that it behaves very much like a computer. For example:
I can use the internet and send an e-mail message to a friend of
mine's GSM cellular phone in Denmark. He, from his cellular phone,
can also send an internet e-mail message to me via the internet.

Services such as described above are not possible with analog cellular
like the bulk of the U.S. cellular systems at the present. We are,
however, quickly transitioning the existing U.S. system to a GSM
compliant system. Then and only then will we in the U.S. be able to
to enjoy all the services a digital phone system can provide.

Keith:

At those frequencies, you might want to replace the rubber duckie
antenna with one of the longer, telescoping types. They work MUCH
better!

BUG IN THE CE-232 PROGRAM ?

Dang! After nearly three years, I found the first real bug in
the program that runs the CE-232 Scanner/Computer Interface. It has
never been reported before and I only discovered it just a few minutes
ago. Weird.....but here it is:
The Mode setting of the scanner will not be correctly
AutoProgrammed if the APF file MODE code is ALL CAPS!
Apparently the AutoProgrammer function ignores upper case
settings of AM, NFM, and WFM. Here is an example of what I mean in an
APF file:

,161,0148.2575,AM,D,L,.....

In the above, Chan-161 will be programmed with 148.2575 MHz,
but will revert to the default NFM mode, ignoring the AM code.
However, the DELAY and LOCKOUT codes (D) and (L) are not
case-sensitive, and can go either way. For the record, any of the
below are acceptable to the CE-232's AutoProgrammer:

,161,0148.2575,am,D,L,.....
,162,1024.6275,am,d,L,.....
,163, 89.5000,nfm,D,l,....
,164, 26.9150,wfm,d,l,....

Make sure all your APF files have the MODE function entered in lower
case, and all will be well. I can't imagine how this one slipped
through the cracks, but it sure did, and not a soul noticed over the
3-yr history of the CE-232. Maybe everyone uses lower-case????
Today, I used upper-case.....and found out.....

Hello Scanner Fans!

Just who IS CISO and what frequencies does he use? I understand that this is a elete Canadian group similar to the US Secret Service or FBI?

I would like to start a data base of everything I can find. Frequencies, offices, antennas, code list(s), anything directly related to CISO that would be of interest to scanner fans to the Great North.

For those who contribute, I'll be happy to include you on my mail list for all updates. No moochers, please and thank you. If you don't contribute, I thank you anyway.

Let's see how long it takes to get Volume 1 out?

Very respectfully,

Uncle T.

Yes, I'm interested. However, I've heard it's harder than you think on some systems, such as L.A. CA has. And I've heard they're changing even that.

3303. BC200XLT lockup?

Newsgroup: rec.radio.scanner

I have let my BC200XLT batteries run down and now after putting on freshly recharged batteries or external power the scanner is locked up. I can push any key with no effect. It is acting as if the keypad lock is stuck on but I can't seem to unlock it. Any ideas? This has happened before but I forgot how I fixed it.

I can't find my manual right now and don't use the keypad lock feature. How would I unlock it if it is more than just a key press on the keypad lock button?

Has anyone come across a source for replacement battery packs other than NiCad?

I am looking for packs that can be recharged whenever I want, or maybe AA packs. I get real tired of having to be so careful about charging the NiCads.

From: anon1723@nyx10.cs.du.edu
Message-ID: <4n8s46$7hh@nyx10.cs.du.edu>
Source record: 233969

I was looking in the neighborhood fence (sorry, I mean pawn shop) the other day, and saw a couple new-looking PRO-23's. Is there an easy way I can tell if they can be unblocked? I didn't see the date code on them. If I turn them over, is there a definite date code by which I can tell if they are unblockable? If not, is there a quick way I can turn them on and see? I know you are supposed to hit the 2, 9, and "search" keys when you turn the thing on. Is there a quick way afterwards to tell if the unit is modifiable. I can't just try to tune in and listen while I'm in the store. They might get suspicious. Also, they were $119 apiece, is this a good price?

Also, on a PRO-23 which is unblockable, can you program it to scan the frequencies between 870-890 at 30Khz steps, like can you program the unblocked frequencies in and scan them, or are you restricted to just manually tuning up and down in the unblocked range. Any help would be appreciated.

Are you refering to CSIS (Canadian Security Intelligence Service)?

CSIS would actually be equivilant to your CIA and not the FBI. CSIS & the
RCMP have a lot of common/shared frequencies.

Hope that helps a bit.

Yes, they have just sent me a catalog that advertised the "Xplorer". It
does everything but tie your shoes! Combination between scout,
interceptor, dc440, GPS!, deviation meter, etc etc. It will list for
$899. Interesting that I called opto to update my scout, they offered a

price, and did not tell me about the XPLORER. Glad I saw it on this newsgroup!

In San Diego County we have a sophisticated system of emergency phones every quarter mile along our freeways. I notice that all of them sport and antenna and a solar recharger. What freqs are these phones using?

The old "button only" roadside call boxes used the 75 MHz band to transmit a coded signal to a nearby comm center. Now, the California roadside emergency boxes are simply cellular telephones, arranged to dial only 911.

After some recent thefts of solar panels and the telephones themselves, they're being retro-fitted to be useless if stolen and their ESN is being tagged as "dial 911 only." Hopefully, this will discourage thieves from taking the phones or sucking up the ENS to use elsewhere.

The source code on the net is not the actual GSM source code in use. It
was an early version of the GSM code.

And for those who think GSM uses PKCS(Public Key Crypto), it doesn't. It
uses a quite a few challenge and reply algorythms to set the key, I've
read about it but it's extremely technical and I found myself just
figuring out the main parts. All in all it's very secure for 99.99% of
the users out there, but, not something you want to transfer national
secrets over.

Hi all,
I'm new to this echo and look forward to gassing about the various things in the scanner arena...by the way have you seen the new WIN-RADIO expansion card from rosetta pretty cool eh, although it seems it could do with a bit more in the way of utility stuff etc and perhaps a bit more of a comprehensive user interface if you haven't seen it it's in this months shortwave mag....
anyway what I thought I would ask is...has anybody got any mods for the yupiteru mvt-8000 base/mobile scanner as i have looked everwhere and can't find
a thing, i would be very grateful if you could let me know especially if there is any way of interfacing it with a p.c , if anyone is reading this is in the dorset area of the U.K here are a couple of freq's for you

AM 146.1000 BRIDPORT VHF POLICE
NFM 452.7500 BRIDPORT UHF POLICE MOBILE
AM 154.8000 MAIN VHF CHANNELL FOR EAST DORSET
AM 155.9500 VHF MOBILE EAST DORSET
AM 155.875 VHF BASE FREQ

ALSO LOCATION OF SOME CELLULAR NODES IN THAT AREA........

1) BEHIND THE FRIARY PRESS ON THE A35 APPX 1.5 MILES OUTSIDE OF DORCHESTER
2) ALSO ON THE SAME ROAD BUT ABOUT ANOTHER 1 MILE FURTHER ON LEFT BEHIND BUSHES
YOU WILL SEE IT ABOVE THEM.(not sure why the two are so close together)
3) EGGERDON HILL APPX 2 MILE OUTSIDE BRIDPORT ON A35 TOWARD DORCHESTER TAKE SIGNS FOR MAIDEN NEWTON AND FRAMPTON AND FOLLOW IT UP THE HILL AND YOU ARE
THERE ALSO THE VIEW IS GREAT AND IF YOU LOOK INTO THE WEST-ISH YOU SHOULD SEE THE BBC RAMPISHAM ANTENNAE (LOVELY SIGHT IT'S HUGE AND FOUR MILLION QUIDS WORTH) ALSO THERE IS LOTS OF P.M.R ETC REPEATERS UP ON THE HILL YOU WILL PROBABLY BUMP INTO ME IF YOUR EVER UP THERE !

anyway iv'e gassed on enough and iv'e gotta go so look forward to hearing from
you all and keep wigging !!!

Guess I will follow up to everyone here.

Depending on where you lived, landline and cellular phone calls could not be placed for one to two hours after the earthquake occurred. As I noted accurately in the online story, this occurred because of system overload. The story is very straightforward, points out that only minor (or moderate if you lived near the epicenter) damage occurred and does not overly dramatize the situation.

If you are suffering a medical emergency during a phone outage, you don't care if the phone is out because of overload or breakage - bottom line is you can't call for help. I, in fact, suffered a medical emergency earlier in the day that the earthquake occurred and was very much aware of the importance of having an operating communications link. Incidently, the next day, a heart attack occurred two blocks from my house (which sadly, ultimately proved fatal)? Who are you going to call when an emergency striks and your phone doesn't work?

The point here is that when the phones are out, the lifeline that people expect to use is not available. If you DO NOT have an emergency, then use of the phone does not matter to you. If you have an emergency, then it matters a big deal. Other disaster situations where phone service has gone out have shown that residents will attempt to drive to the nearest source of aid - typically a local fire station or police subdivision. Unfortunately, they didn't have communications either during this phone overload outage situation.

The local ARES/RACES plan is currently being modified to provide backup communications support at the site of ocal government agencies (e.g. fire stations) during telephone outages. Even though there was no "major emergency" and no one died - the point remains - a hell of lot of people could not have

called for assistance if they had needed to. That is the kind of communications outage for which ARES/RACES should be providing solutions.

This quake is yet another reminder to have the proper plans in effect *before* someone gets injured or dies. The story seems useful to others who are also designing emergency prepardness plans.

Incidently, since a few readers don't get it: Ham Radio Online is a hobby - it is free to you, self-funded, no advertising. Its an online ham resource. Some people build repeaters for other's to use - we decided to build an online ham radio resource instead.

3322. 410.075 MHz???

Newsgroup: rec.radio.scanner
Date: 1996-05-13 00:00:00 UTC
From: hpeach@pop.uky.edu
Message-ID: <4n601g$rks@service2.uky.edu>
Source record: 234006

At two airports in our state, both with FAA offices and one with a National Weather Service office, I have monitored digital transmissions on 410.075 MHz (a federal frequency). This has been verified as not an image using multiple radios with different IFs.

Does anyone know what this frequency is used for and by whom? The NWS office mentioned above recently closed, but the transmissions did not stop. A friend who should know about all radio transmissions occuring at one of the airports says there is no record of its use by the FAA or NWS at the facility.

The transmissions are non-BEL202 and don't sound like 1200 bps (they sound faster and "more digital"). The transmissions are packetized and occur about once every 5 seconds. The packets are of varying length (it seems there are about 3 lengths). It is know they are not a part of the Low Level Wind shear Alert System, which operates in the 162 MHz area.

I know that this frequency is frequently attributed to the NWS for use as a UHF link to its NOAA sites, but this does not seem to be the application in this case. Any ideas would be appreicated.

Marc,

I would highly recommend a beam antenna with at least 5 elements.
Mount the antenna vertical and point it right at the airport. Use
good coax (not RG-58). You can add a rotor later if you like.

You could also add a second omni-directional antenna with a "A"/"B"
Switch or a 2-way splitter as a mixer. If you use the 2-way splitter
method, install a 8 or 10 element beam to overcome the splitter loss.

Uncle T.
WA6IGJ

>> Where I was living before, I was at about 4 miles of the airport,

The key is stored in the exchange and when signalling over radio the
mobile is given a temporary ID which is ment to make the roaming and
calling more secure.

About the GSM encryption I personally beleve that I never will be able
to recive phonecalls. But note that the Swedish governement regards the
GSM securety so low that it must not be used for any conversation that is
even on very low classifaction level.

>
>Do the mobile anti-scanner laws (NY to be exact) apply to portables too,
>or just mounted mobiles? What about a scanner in my pocket or on belt?

NYS Vehicle and Traffic Law $ 397:

A person, not a police office or peace officer, acting pursuant to his special duties, who equips a motor vehicle with a radio receiving set capable of receiving signals allocated for police use or knowingly uses a motor vehicle so equipped or who knowingly in any way interferes with the transmission of radio messages by the police without having first secured a permit to do so by the person authorized to issue such a permit by the local governing body or board of the city, town, or village in which such person resides, or where such person resides outside of a city, or village in a county, having a board of supervisors of such county, is guilty of a misdemeanor, punsihable by a fine not exceeding one thousand dollars, or imprisonment not exceeding six months, or both. Nothing in this section shall be construed to apply to any person who holds a valid amateur radio operator's license issued by the federal communications commission and who operates a duly licensed portable mobile transmitter and in connection therewith a receiver or receiving set on frequencies exclusively allocated by the federal communications commission to duly licensed radio amateurs.

This law is so badly written you could drive a truck through it. Example: Who can get a permit to knowingly interfere with police radio communications? Any good English teacher would smack the writer(s) of this law silly.

What does it mean (intent)? Simply this: Putting a scanner in your car, unless you are a police/peace officer and are doing so as required by your job, then you are guily of a misdemeanor. Notice it says "equipping", not "installing". It could have been worse -- say "possessing" -- how would you get the darn thing home from the store?

Other examples of how badly it's written - and what you could be convinced to argue that it says - note that these "interpretations" are just bad examples, and not based in reality:

1. Hams are allowed to interfere with the police transmissions. They are exempted from the statue.

2. Hams exempted under this statue don't necessarily have to be using that transmitter/receiver combo NOW, nor need it be the set in question. They just have to use it.. "Yes, your honor, I work 2M from home.. So??"

3. If you use any of the amatuer bands where the band is shared with another service, you're out of luck. The band must be EXCLUSIVELY allocated to the amateur service!

4. You cannot get a permit to have a scanner, only one to interfere with police communications...

A copy of the VTL can be had at any DMV office for $1.00...

At a flea market this morning, I purchased a perfect mint condition Electra Bearcat III (date of manufacture Jan 4, 1975). This unit is pristine; the vinyl is completely new, the oval speaker grill looks new; whoever owned this never removed it from the plastic, I think. And... I paid $15. :)

My question is this: I would like to keep this, but what is it worth to scanner collectors (if anything)? And does this have any historical significance among scanner enthusiasts?

Any answers would be appreciated!

I'll second that recommendation! I have an AOR1000XLT and thought the
manual really sucked! It looks like it was translated into English by
someone who didn't know English very well! Not very easy to read! The
Guide mentioned above is much better, and gives you some short cuts to
programming multiple freqs. It comes with a quick reference sheet that is
meant to be folded up and stuck on or near the scanner. I stuck mine in
the belt clip to make sure I have it! I don't program freqs that often, so
I usually have to look it up on the sheet! (Maybe I'm just dumb, huh?)

I have a SONY ICF-SW55, a shortwave radio. It was made to pick up SW frequency, and I have had lots of fun using it this way in the past. It also has a feature of picking up frequencys from 76-108Mhz, even though those are just local radio stations. I was wondering if there is some kind of modifications I could make to at least permit me to pick up the next highest band, which I think is the aronautical band. If this sounds stupid, I apoligize, as I am a beginner, and have only had real experience dealing with MUCH lower frequencys.

: GT> You haven't shown me squat-diddley. You obviously can't get your
: GT> newsreader to quote correctly or even keep a follow-up in the ongoing
: GT> thread.

: OOOhhh, now let's 'cut' on something OTHER than substance, since you can't
: fault my reasoning.

: I'm posting on a Fido BBS (_MY_ Fido BBS) thru a UUCP feed of newsgroups, so
: if there's any 'problem', it's NOT here, but on my ISP.

: I'm STILL waiting for you to read the Constitution and/or ask a lawyer, and
: then ADMIT you're wrong.

: But I'm NOT holding my breath.

: ... Your computer does what?????

The original (ur-post) that I replied to was a journalist posting from his work account asking for info on the best scanner for a trunked system. I replied to him that it was _my_impression_ it was a violation of the ECPA to profit by monitoring. At that point several so-called media wannabe's jumped me saying that I'm wrong, but have offered absolutely no proof of any exemption they have from this law.

Mr. News tried to discredit me by saying I knew nothing about how the media operates. I did his homework for him and disproved this by email. I planned and implemented - including procuring Moto crypto codes from the local PD - the radio system for a medium-sized newspaper I worked at for 13 years. I've been a professional radioman as well as an amateur, which is why I got that assignment.

This was what got me thinking about the legality of monitoring since we basically sold what we heard and how easily the PD could change their crypto if they disliked anything we wrote about them. BTW, our lawyers were unable to tell us whether we were exempt from the ECPA, but decided that since everyone else was doing it, it was probably safe.

I have even posted the paragraph from the ECPA (at least twice) that I think applies to _all_ folks monitoring, but so far none of you folks defending the media's right to do this have offered any refutation except some lame phrase about the Constitution.

I'm perfectly willing to be proved wrong, but why should I do your research for you? I scan as a hobby, as the law clearly intended, and if I break any of the laws I consider silly or that were paid for

by the cellular industry, at least I'm _aware_ of what laws I'm breaking.

You guys seem to care less and I consider that folks that monitor the bands for profit (including these 'pager notification networks') are ruining my hobby by forcing services to encrypt if they don't wish to be monitored. The secondary problem I have with the media monitoring using crypto provided by local law enforcement is the dependence the media have on same if they want to continue to be provided the codes, notwithstanding the aggrieved protests by Mr. News that it'd never happen in his enlightened town, only in those 'redneck' places.

Since you guys clearly aren't interested in anything but arguments and aren't going to post any proof that you're exempt, I feel I have the right to heckle you every time you post more nonsense and personal attacks until you prove me wrong and I shut up about it.

The BC III was probably the most popular Bearcat crystal scanner
so it isn't very valuable. I have 3 or 4 of them.

From my FAQ "Buying a Used Scanner:"

Bearcat III (Electra): 1976 vintage. 8 channel crystal
controlled scanner. Requires optional front-end circuit
board for VHF-low, VHF-high, and UHF bands, but only 2
boards can be installed within the radio at the same time.
Two crystal filters. No aircraft band coverage nor rescan
delay. Front mount speaker sounds good. Strong local
oscillator radiation often causes interference with other
scanners in the same house.

Vampyr (palomino@ritz.mordor.com) wrote:
: My friend and I were arguing today about owning a scanner that has been
: modified. I insisted that *owning* a modified for cellular scanner was not
: illegal, my
: reasoning came from the Scanning FAQ, it says that private sale of
: modified scanners is still allowed, so lemme get this straight, you can
: own one to sell one privately, but buying is illegal? I never claimed to
: know the letter of the law when it comes to this, but it doesn't make
: sense if one can sell a scanner and not own one.

: Is modifying a scanner illegal?

: Also, let's say I do have a modified scanner, and for some reason I got
: busted, would I be charged for listening to cellular just on the basis
: that my scanner can? the question that comes to my mind is how could the
: FCC prove I was listening?

It is not illegal to modify a scanner. Nor is it illegal to buy or sell
a modified (or modifiable) scanner. It is illegal to import or
manufacture a scanner that lacks FCC certification, and the FCC has been
directed by congress to deny certification to any scanner that is able
to pick up cellular frequencies or to be "easily" modified to pick up
such frequencies.

Signals only get reflected by the Ionosphere at certain angles. So If the
signals are sent straight up or at a very slight angle, they will go
through.

3342. Opto Scout

Lately, I've been considering buying a scout. I just called Amateur Electronic Supply to find out the price. $449.00. I'd say thats kind of steep. Is the scout worth 449? I don't have an 8000 or anything so the reaction tuning does me no good(and honestly not interested in it anyways)

For that price, I'd expect it to be fairly sensitive. I need to pick up HT's transmitting at 1 or 2 watts from a distance of a couple hundred feet. I expect to pick up fast food freqs(on UHF) by driving through the drive-thru. I expect to get hits from celluar phones in cars driving by.

Are my expectations too high? Or is there another more affordable freq. counter? I paid $79.00 for my RS freq counter and am very disappointed.

Keith

3343. Thunderbirds Coming Soon

Newsgroup: rec.radio.scanner

Greetings,

I have just gained access to this group and need some information.
I am sure this question has been asked and answered countless times within this group, so in advance, sorry.

Here in Colorado Springs one of the major events of May is the graduation ceremonies of the Air Force Academy. The Thunderbirds always show up, and weather permitting, put on their air show. Can anyone tell me what frequencies they use? Air-to-air, air-to-ground, and whatever else?

Thanks in advance.....

Mike ();

O.K. I not really in the market being as I just bought a pro2005 and am very happy w/it but I was curious:

What is considered (price completely aside) to be a dream scanner? By that I mean is there something available that just practically recieves everything that's broadcast throught the air? In AM FM NFM WFM and any other modulation? Something that could act as a short wave reciever AND a scanner something could decode information and interface with a computer? Something with complete freq coverage from like 10kh to 3gz?

Are there any scanners that can do all this or close?

Hmmm... I got a preban (cell unblocked) ICOM R1 in excellent shape for 75%
of the cost of a new, cell blocked one! Gee, I guess that was a waste,
huh?

New RS scanners are OK if you don't care about cellular, and you don't
want to sell it later!

>Why?
They happen to be darn amusing. An old (1983 I think) catalog I have
lists a 5mb hard drive for something like $4999.95 - compare to a 2GB
drive available for ~$300.00. The times sure change...

[snip]

410 MHz is right on the border of two subbands. The two sub-bands cover
radio astronomy, meteorology, hydrology and other fixed mobile
applications.

3348. Regional Scanner Mailing lists.

If you live in Massachusetts, you can join the localized
mailing lists I've created. Both lists have gray areas around
them, so we do discuss areas outside of the primary regions.

(These lists are meant as regional alternatives to the)
("scan-l" mailing list which is nationwide.)

scan-mass-east

This list covers all of Eastern Mass from West of Worcester
to the East right into the water.

To subscribe to this list, send a message like this:
To: scan-mass-east-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe

The list is available in digested form too. It's address is:
To: scan-mass-east-digest-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe
Digests currently go out Monday and Thursday mornings.

- -

scan-mass-west

This list covers all of Western Mass from East of Worcester
to the West.

To subscribe to this list, send a message like this:
To: scan-mass-west-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe

The list is available in digested form too. It's address is:
To: scan-mass-west-digest-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe
Digests currently go out about every two days.

If you live in the New England area and are interested in the
technology of scanning, come and join our new mailing list!

= =

New England Scanner Technology

Here is where you'll find people talking about equipment,
gadgets, and accessories related to Scanning. No chatter
about groovy things heard on the McDonald's drive through! :)
We'll keep the regional stuff on regional lists.

To subscribe to this list, send a message like this:
To: nest-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe

The list is available in digested form too. It's address is:
To: nest-digest-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe
Digests go out once a week, early Monday morning.

- -

If you have direct WWW access, you can get on (or off) of the
lists via the simple interface at:
http://www.netspace.org/cgi-bin/lwgate/nest/
http://www.netspace.org/cgi-bin/lwgate/scan-mass-east/
or for the digested versions:
http://www.netspace.org/cgi-bin/lwgate/nest-digest/
http://www.netspace.org/cgi-bin/lwgate/scan-mass-east-digest/
depending on which list you're interested in.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Abstract

This article contains product review summaries for more than
60 old and new scanner radios and monitor receivers. Other
topics include:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other
radio hobbyists. This article describes a few of the FM
receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had
sellers look me square in the eye and tell me their radio
worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base | scanners, see "Tips for Fixing Bearcat Scanners," by Bob | Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Grove Enterprises (Brasstown, NC) and Radio Shack repair scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" | and carving the letter "U" on the cabinet. G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM | receive capability, like the flamboyant turquoise Sonar | Sentry FR-103 portables, Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec | MCP-1 , Bearcat BC-101 , and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE | Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General * Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of

synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency | and Electra (Bearcat) built most of the scanners in their | Indiana and Puerto Rican factories. Uniden, a large | Japanese electronics company, purchased the scanner product | lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat | BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO- | 2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and | older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable |

Note: Reprints of Monitoring Times articles are available
for $2.00 each (plus self addressed stamped envelope) from

Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this $2.00.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

ICOM

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000.

Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner

offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a | keyboard and numeric display. LED readout. |

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good | scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good

internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of | preprogrammed channels Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. |

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but

very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification | information, see my column in June 1996 Monitoring Times.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like

case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable | scanner which is a smaller successor to the BC200XLT. | Includes 800 MHz band. 10 priority channels. Service | Search, including WX. Up to 10 frequencies can be locked | out during conventional search, 20 frequencies from Service | Search. Unique feature tells whether a given frequency has | already been memorized. 10.8 MHz and 450 kHz IFs, with | images 21.6 MHz away. 4 cell BP-120 internal NiCd battery | pack. Marketed as BC230XLT with two BP-120 battery packs | and CRX-120 dual charger. See "The BC220XLT/BC230XLT | Portable Scanner," by Bob Parnass, AJ9S, in Monitoring | Times, April 1996. |

BC230XLT (Uniden): See BC220XLT. |

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H

eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency | control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells.

Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills.

Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1985 vintage. Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-62: 1984 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air

band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator

circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went | out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and

Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your

Arsenal," by Bob Parnass, January 1996 Monitoring Times. |

Custom Color Map & Report |
of Transmitter Sites Near You |

As I have already done for hundreds of radio enthusiasts, |
companies, government agencies, and organizations across the |
country, I will locate FCC licensed and selected FAA |
transmitter sites in an area of your choice, in any state, |
and produce a custom RadioMap(TM) report, including an 8- |
1/2" by 11" scaled color map, protected by plastic. The map |
is marked with transmitter sites, cities, highways, |
airports, military installations, national parks, etc. |

RadioMap allows you to identify antenna sites and visualize |
the transmitter locations in your neighborhood, near your |
office, and other places of interest -- from VLF through |
microwave. The report lists frequencies, callsigns, and |
licensee names. RadioMap covers police, fire, local |
government, TV, business, industry, common carrier, |
railroad, trucking, and many more types of transmitter |
sites, excluding ham radio stations. Wireline and |
nonwireline cellular phone and AM/FM broadcast transmitter |
sites are clearly marked using unique color icons. |

Industrial customers use RadioMap reports to survey the |
"radio environment" prior to installation of radios and |
wireless microphones at customer sites. RadioMap is used by |
the maritime and broadcast industries, as well as ham radio |
operators to solve intermod interference problems, and has |
been very favorably reviewed in RCMA Scanner Journal, |
American Scannergram, and USSN. |

The RadioMap processes and software are unique and |
proprietary. Unlike "more tame" maps, RadioMap shows the |
locations of military bases, ammunition plants, arsenals, |
weapons factories, and other military installations. |

For a flat fee, you choose the center location, and I choose |
the range, depending on transmitter site density: |

suburbs: 5 mile range (100 sq. mi. area) |
rural areas: 10 or more miles (400 sq. mi. area) |
dense urban area: 1 - 2 mile range |

Longer ranges for additional charge - call for pricing. |

A custom RadioMap report costs $20.95 plus $5.00 shipping |
and handling. For an additional $4.00, I will include a |
custom frequency allocation histogram, a 0 - 1,000 MHz |
"spectrum analyzer-like" display showing spectrum usage by |
the transmitters in the map coverage area. Send check or |
money order payable to Bob Parnass for $25.95 for standard |

or $29.95 for deluxe RadioMap report with histogram. |
Include your name, address, and telephone number, along with |
center location (nearest intersection of 2 streets, or |
latitude & longitude) and mail to: Bob Parnass, 2350 Douglas |
Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central |
time. For a brochure, send SASE. |

Find and identify transmitter sites with RadioMap(tm)

3350. Trade - PRO-43 + MR8100 for MR-8100

Newsgroup: rec.radio.scanner
Date: 1996-05-13 00:00:00 UTC
From: bfarris@c2i2.com
Message-ID: <4n7lhu$pqr@news1.goodnet.com>
Source record: 234034

I've got a PRO-43 with the cellular mod done which works great, with telescoping antenna and charger. :-)

I've also got a Uniden MR-8100 in pieces in a box which needs a couple of ribbon cables to be put back in good working order. :-(

These are both great radios. The 8100 worked fine until I clumsily peeled back a couple of foil conductors on the above-mentioned cables. I've since lost the cables. I'd trade both of them for a Uniden MR-8100 in good shape and good working condition.

Please email me if you're interested.

Brad Farris
bfarris@c2i2.com

**
** - Ed, Monitoring San Diego

CPD has a trunked system for detectives and special ops. Much of that traffic is scrambled, but occasionally it is in the clear. Try the 856/860.9375 system for this.

The main CPD action is on the 460.025 thru 460.525 conventional UHF freqs (all are repeaters except 460.525). These are the dispatch and citywide freqs.

CFD is on 153.770 (S), 154.130 (N), 154.220 (Admin)
153.830/154.295/154.385 (Fireground) and 460.600,460.625, 462.950, And 462.975 for ambulances.

See the ScannerMaster IL Communications Guide, the IL Pocket Guide, Monitor America, or Police Call, Volume 4 for more information.

The only complaint I have is that the Mac version of the search program doesn't use "Command" key shortcuts.

I especially like the fact that they use standard .dbf files for the data, which allows me to use my own database to manipulate the data.

Mike-
The frequencies listed for the thunder birds are:
141.85 143.85 140.00 236.6 236.55
273.5 283.5 295.7 322.3

there are more but having monititored them myself on two previous
occasions once at Andrews Air Force base in Maryland and once at
Emberey-Riddle in Daytona Florida both times they used 141.85.

I was wondering if anyone was interested in purchasing a brand new
Motorolla Advisor pager. It is programmed with the Breaking News
Network (BNN). It is programmed to receive the New York news groups.
It relays breaking news stories regarding Police, Fire, EMS, as well as
local and national news stories.
I purchased the pager for $150.00 I will sell it for $100.00 It has
2 months of free BNN in it as of now.
If anyone is interested, please contact me:

Pager: (303) 784-0045
Voice mail: (302) 831-4000 ext# 38232
E-mail: trooper@udel.edu

Thanks,

Doug: trooper@udel.edu

>
>Are there any scanners that can do all this or close?
>
>

There are a few that come close:

Base:
The AOR3000 has all of the above, but goes to about 2GHz (I think thats right). The AOR5000 also fits this bill with the freq coverage topping out at about 2GHz. New, they are $1000 and $1800 respectively!

Handheld:
The AOR8000 has all of the above except for the 3GHz top end too (~$600 new).

You left out SSB in your demod requests. I think the AOR3000 & 5000 have that as well.

Feel free to correct this if I'm wrong. I'm going from memory here!

>
>Rgrs
>
>David
>very

True the swedish government use an Ericsson scrambled mobile phone stored in
a case. I have seen one once. Pretty neat.

About the encryption, the key is 86bits long and made up of two parts, a
64bit user key known only to the mobile phone and the central computer and
is never sent over the air. The other 22 bit key indicates the positon of
the frame being encoded in the GSM hyperframe.

The encryption algorithim formula changes slightly every 20ms. It takes 3h
28min 53s before the same formula is used twice.

I hope this is correct, But Scanman is the Expert.

Regards,

Rickard.

I'm not sure what kind of battery pack this is:

If this is an internal battery pack (ie NiCads solder-tabbed together and shrink wrapped in plastic) you can get just about any configuration you need from Digi-Key, here in the US. They use Panasonic NiCads and make whatever you need! Very good prices too. They have a $25 min order though, so you may have to get 2 packs! They come with two thin metal solder tabs exposed and the + tab is marked.

My ICOM R1's internal battery pack had 2/3 AA's (same size as AA's but 2/3 the height) wrapped in a pack of 6 for a 7.2V pack. ICOM wanted $65 for a replacement! I bought 2 from Digi-Key for $42 (including shipping). I had to use the old battery's connector, but it was worth the10 minutes to desolder and solder it on the new one to save $45 each!

If this is an external battery pack with a case that slides on the bottom, ignore this (unless you can open up your old case and swap out the pack inside)!

Digi-Key's number is 1-800-344-4539.

If you tell me the cell size and configuration I can give you the cat# for the pack.

I think the equipment is illegal. I heard a few months ago the cops did a
big bust on folks who had got a hold of some of these systems. Don't know
what law it falls under though.

>> I expect to get hits from celluar phones in cars driving by.

I got a Scout just the last couple of weeks and I really like it!
I am using a 8K and reaction tuning and this is the best part. Just today I had it (them) setting in the seat of the car and it followed a phone from a car in front of me.

When I just got it I went to the local mall and even tho I knew the freq. I put the Scout on capture and walked to Radio Shack. When I came out I had hits on the Mall freq and the R/S 900 phone.

This thing does work. It makes a good counter too.

> probably knows a lot more about this.

Good explanation-----^

Actually it can give the command to generate a new key with each handoff.
So when you go to a new "cell" you get a new key.
Apparently the system monitors how long each key has been used and will
change it at various times if your not moving. Another interesting thing
is that it has the capability (but rarely does) to go to a new key each
time it changes channels.

Hmmm...maybe because YOU didn't design the hardware or write the firmware
for the interface !
A simple oversight by the programmer that they didn't include a routine
to subtract 32h if the received ASCii character was above a capital Z.

I never heard back from you re: your challenge of my technical ability.
Funny...you disappeared after I intelligently answered all of your
questions. Dropped the whole issue like a hot potatoe you did !

That url talks about the RS10/11, 12/13 & 15 satellites that were just
launched in the last few years. They're like the OSCAR satellites,
they're for use by ham radio operators.

This page:
http://amsat.org/amsat/features/firstsat.html

has info on the early OSCARs and other satellites, including Sputnik 1.
BTW, it says that Sputnik 1 used a freq of 20.007 MHz.

3374. NJ - Waldwick Area Freqs Request

Newsgroup: rec.radio.scanner
Date: 1996-05-14 00:00:00 UTC
From: David Levine <levined@ccmail.nhq.sony.com>
Message-ID: <3198F7C9.6103@ccmail.nhq.sony.com>
Source record: 233858

I am new to scanning and have found some frequencies in my local area - Waldwick, Ho-ho-kus, Allendale, Wyckoff and Saddle River - but I don't think they are all accurate and I know I'm not getting all calls - Police, Fire, etc.

I got the freqs from the Police Call guide (Radio Shack), but they don't seem to be complete. Does anyone have any accurate info for the above areas? I would appreciate it!

I have a new BC230XLT which gets pretty decent reception - I hear NYC info using the SVC option (Police / Fire / Air / Marine). I haven't hit on any local freqs using the SVC option though.

Thanks,
David

* odd pairing
Also just explain how it works .. Most of the headsets have 2 buttons, one
for talking to the customer at the speaker, and the other for talking to

onther employes (or anyone with a headset) so often theres 2 freqs (put these 2 in a bank and block out all others then scan those, it works fine .. if you want to get free food you could do this, place your order then pull up listen to the persons order given behind you then at the last window claim you had two orders when they ask what the second one was (if the do) tell 'em..

Same here. Unless you connect it directly to a frequency generator, it just
generates random readings. Try this test: short out the input. Do you
still get a reading? I do. With no input the count should be zero, of
course. It's junk.

I have one of those! I bought it on sale at RS for $99 (one of those impulse buys at the register)! I like it a lot. It was smaller than my PRO-34 and picked up all of my local police/fire/emergency freqs. The twenty channel limit is a bit restrictive, but it was enough for my area. I modded mine to scan/search twice as fast by replacing the microcontroller crystal with one at ~2X the freq. I think that sucker scans all of its channels twice a second now! The faster speed is really nice in search mode though. When I travel, I'll scan through different freq ranges to find some interesting freqs to listen to. I was in Baltimore, MD when the Pope was here and just search though some freqs until I found some of the stadium crew freqs. Only took about 10 minutes to get several good ones! Not a bad scanner for the price. Since its about 1/4 the cost of my other scanners (AOR1000XLT & ICOM R1 now), I don't worry about taking it out!

Well, there's my $.02

From what I hear about NiMH (Nickel Metal Hydride) batteries, you don't
have to worry about memory effects, so you can partially discharge and
recharge without any problems. I think you still may have to worry about
over charging though. Unless the battery pack or the radio has circuitry
to prevent overcharging. I've heard you can purchase AA's in NiMH, but
haven't heard about any scanner battery packs (Uniden or otherwise) with
NiMH batts in them.

I suppose that could be argued. However, the FCC has never attempted to claim that cutting a jumper or removing a few components is manufacturing. I think that you are, perhaps, thinking too hard.

Actually, holding my cordless phone close to the frequency counter yields
the proper frequency. Also, I've had hams broadcast in the 440mhz region at
one watt froma distance of 50ft-100ft, and it picks it up. That's where
I've been most impressed from it. Everywhere else though, It seems way too
insensitive.

The US is not going to GSM, they are fighting over TDMA/CDMA, neither are working very well. I suspect the US didn't want GSM because of it's inherent security. But, I did hear that the new PCS may be GSM compatable.

3391. Scanner thru your car radio

Newsgroup: rec.radio.scanner
Date: 1996-05-14 00:00:00 UTC
From: Tfugate@pop.uky.edu
Message-ID: <4na7bi$tj@service2.uky.edu>
Source record: 233908

I ran into a nifty little device at Walmart last Saturday. I was looking for a way to feed my mothers new Sony CD player into her OLD Panasonic stereo(you know the type, AM/FM/Cassette/Phono). Walmart sells "Sound Feeder". This is a real small, weak FM stereo transmitter designed to feed the "sound" from one of the personal CD/Cassette players through your car radio. (While I stole +12v from inside the stereo and mom is happy that is another story). My Pro34 has the typical pathetic and undrpowered sound of most portable scanners. I plugged the stereo "earphone" plu into the earphone jack on the scanner. I was kind of surprized at how it sounded through the car radio. I rigged an adaptor to attentuate and combine the stereo plug to a mono 1/8" and that works a lot better. The "Sound Feeder" has a voltage regulator (reducer) that will give you 3.9/4.5, 6, or 9 volts. It has those nice little instant chango plugs so you can make the coaxial power connector shell either positive or negative.
For $20.00(+tax) it was a simple soulution and my wife can use so she can listem to her CD while she is "out and about". About the best $40.00 (I bought 2, one for mom and one for us) I have spent recently.
I hope that this sugestion is of use to others out there.
Good luck
(I neither work in, own stock, nor have any other connection with Walmart [other that as a customer]).

So here with my analog motorolla cell and mpc-10 modem, I can't use the internet or send an e-mail message? Hmm, you must not be reading this message then.

These are possible with analog cell-phones, maybe not as efficient as digital, but very much possible.

One GSM doesn't use PKCS so this is a moot point but, say it did. Each
phone would have it's own public/secret key, each transmitter repeater would
have it's own key. Ever hear of a STU-III? It uses the same idea. Each
phone has it's own key. So, there is no 1 secret key. Sure you
could crack one, but that would leave you with one side of the conversation.
The whole source code of PGP is available at many places, no one has cracked
it (if they have they haven't said anything).

Well, it's most likely for law enforcement and licensed to use the GSM
proprietary stuff. 20Kpounds is what? $50K? For most of us, that is way
beyond buying.

>Like they are in PGP, right. No one "in the PGP industry" has the private
>keys which will decrypt anyone's message at will, do they?

Which is just what is done. Some time ago I read an article about the GSM system
and I recall that the scheme works something like this (this is from memory,
so it might not be 100% correct):

When you turn on your GSM phone it connects to the nearest provider, that
has an agreement with your original provider. At this time you are assigned
a temporary id. This is the only time your real id is exchanged over the air.

On all subsequent operations it's your temporary id that is used.

You are also assigned a temporary encryption key. This is sent to the
telephone, which passes it to the smart card which in turn uses a built-in
algorithm to generate the real encryption key to use. At the same time the
provider sends the temporary key to your original provider which generates
the real key using the same algorithm as the card. This key is sent back
to the provider and now the conversation can be encrypted/decrypted on both
sides using a key that has never been transmitted over the air and that the
provider you are connected to does not need to know how was calculated.
I'm not sure if you get a new key for every call you make, but someone
probably knows a lot more about this.

> replacement battery pack for my AR900. THanks

The Battery pack was originally a Sanyo Pack usually also available from
Sanyo Distributors but you would have to get the little 2 pin lead.

The Same Batetry pack was used on the AR880, AR900 and AR1500 (although
later AR1500 have a three pinned connector to the PCB rather than 2).
Try EDCO/EEB in the States, if not we can help. AOR (UK) are at
info@aor.co.uk

Hope this helps.

3402. Secret Police Bands and Channels

Newsgroup: rec.radio.scanner
Date: 1996-05-14 00:00:00 UTC
From: doc@dxnet.com
Message-ID: <3198b344.7278935@news.dxnet.com>
Source record: 233919
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Secret Channels:

Law enforcement, like many news agencies resort to cellular telephones for security and quality of transmissios from very remote sites. In the case of studios, competing stations monitor each others channels to get those hot 'scoops'. Studios now mask dispatches as well as any law agency can.

Many police and sheriff departments use "mutual aid" frequencies for clandestine operations. Each agency/county/city is fully licensed for operations there too. These are channels that law enforcement and fire agencies use to communicate interstate, inter-county and city. Major fires and active persuits are just two uses. Nothing prevents a police department, in example, from using those channels for stake-outs, or drug sweeps. These are some used in California:

Law Enforcement: 17 Channels, NALEMARS/CLEMARS/CALCORD/CLERS
Fire Mutual Aid, Statewide: 4 Channels
Local Government:: 5 Channels, CMARS
California Interagency Mobilization Plan (Federal) 16 Channels.
Inter-Desert Law Enforcement

It is important to note that Federal operations often supply special radios for communications as required. you can rest assured they are not on your local cop channels, but federal channels.

It is strange how some cities encourage it's citizens to monitor law and fire channels and other cities act like monitoring a felony.

My feeling is the more citizens know about activities in their neighborhoods, the better! While I would never encourage a citizen to 'step-in' and capture bad-guys, if a neighbors home is involved in a 459, I would encourage monitoring neighbors to at simply look outside for numbers of persons involved, descriptions of persons and cars. A second reason is that you could and would be highly suspect as officers arrive and you are running around outside, very excited!

Please know that a very high percentage of crimes commited in our cities are by persons very desperate for drugs. No TV, stereo, or VCR is worth risking your life for. You need to do only two things, observe and report.

As you listen you begin to learn what your law enforcement teams are up against. Remember them when those special bond issues show up on your ballot.

Uncle T.

Andrew,

Please, let's get the record straight here. Scanman Version 12 IS everything you said it was and much more. Brian Peterson wrote that fine series of programs and he checks in here on the NewsGroup from time to time.

Please know that the program was NOT free and Brian did ask only a $20 donation. It is a very reasonable sum considering the hundreds of hours that had to go into creating such a fine program. Those of you who got the program here and thanked me later know. All versions were posted elsewhere or regular BBS's, uncrippled and complete, however, in Brian's words, 'only a handfull supported it'. I suspect that is why there will be no Version 13.

I posted Version 12 here, but the NetGods killed it and deemed it unsuitable for reasons that are beyond me. The NetGods also sent me a warning letter asking me not to repost it, or similar programs here again. I will honor that request/demand.

This is the second important part! Contact: jwz@kuentos.guam.net for your copy. He is offering it in either ZIP or EXE format. DO NOT email me for a copy! I highly recommend SCANMAN 12 and that you send Brian at least $10 if you agree.

Uncle T.

The cassette adapters for CD's will work too! I have a Sony adapter I use for my portable CD player, and I like the sound much better than the RF modulator adaptors I've heard. Got the Sony at Wally World for $18 or so. These are passive devices that require no power, except for your audio signal, so you don't have to hack into your boom box or home stereo to find 12VDC if you want to use it at home! You do have to have a wire going from your CD/Scanner to the tape deck though.

What kind of range do you get with those sound feeders? Can any FM radio within 20-50ft or so pick it up?

Are there yet any comparisons between the ar5000 scanner/receiver and other
separat top of the line receivers both in hf and vhf region

It's probably a hell of scanner with a lot possibilites when it comes
to computercontrol etc but how does it do as a receiver.

When you pay that kind of money i would probably rahter buy separet units for hf and vhf/uhf area if it doesn't stand up against other quality receivers (particular icom-7100 int the vhf/uhf region)

My RS counter will pick up the cordless freq, but you need to hold the antennas right next to one another to get the KHz part of the display accurate! I think the RS counters are not very sensitive compared to other brands! It will lock on to my cell phone freq a few feet away though. You may want to check the specs on the RS counter, I'm not sure it will measure down to DC, that may be why you are still getting a reading with the input shorted! Other than the sensitivity issue, I think its pretty good for the price. I bought mine with the intention of using a probe to measure freqs on a board!

>
>He said an SSB receiver AND CB radio. Use the CB to feed the
>SSB receiver with AM sig, works as good as any descrambler.

An acquaintance told me the following: he once was monitoring a normal FM police transmission and he must have been bored or something because he switched his unit over to one of the SSB modes (he forgets which) and when he heard the signal transformed into those characteristic duck sounds he thought "Hmmm - that sounds familiar" and just out of curiosity he then tuned in his neighbor's inverted cordless using normal FM, backed off from that freq just a few kHz until the signal was almost lost and then switched over to either LSB or USB - bingo! intelligible (if not clear) speech. So it supposedly does work if your unit does SSB.

A frequency counter locks on to the strongest freq it picks up (and doesn't continue on to find other freqs). I was under the impression that the Scout would scan, lock, store a fairly strong freq, and continue on to find the next freq and do the same. If this is true, then they are two very different devices (and should be for the price difference)! If not feel free to correct this and explain the difference!

Thanks,

PKH

Back of man! THE DIGITAL DATA IN GSM IS ENCRYPTED BEFORE TRANSMITTED.

>which you can hear. While GSM could very well be made to decrypt and
>encrypt its outputs/inputs, there is presently no reason to do so. A

There is a very god reason: People talking on the phone don't want to
be eavesdropped on.

Why do you think USA got their illegal listen to cell-phones conversation
and illegal to manufacture "easy modifiable to cell-capable" scanners??

>scanner user can not make sense out of the digital data the a GSM
>phone outputs - but not because it is encrypted ut simply because it
>is digital. Scanners are designed to listen to analog signals; ie:
>normal voice.
>
Shurely you could ad the necessary circuit in a scanner to receive
the digital data (like scanners capable to receive am fm wfm ssb cw tv-signals
etc) but without the means to decrypt it back to sound it would just be
a lot of completely meaningless 1 and 0'os

I am thinking of buying ScanStar for Windows having tried the demo
version. I am running a AOR-3000, AOR-8000 and Kenwood R-5000.

Before going for it I would be grateful for any feedback from users as
it is not cheap here in the UK.

Thanks, in advance for your help. Please reply either here or by e-mail.

3414. Need scanner recommendation for Winston Cup races

Newsgroup: rec.radio.scanner
Date: 1996-05-14 00:00:00 UTC
From: jsour@vnet.ibm.com
Message-ID: <19960514.151114.123@vnet.ibm.com>
Source record: 233931

Hi,

I'm interested in purchasing a scanner for listening to drivers and
their pit crews during Winston Cup races. I see several scanner sources
that sell Uniden Bearcat for this use, which have had the external
volume jack modified for higher volume output for use with headphones.

It appears from monitoring this news group people seem to like the
Radio Shack scanners better? Is this due to the more mods being
available for the RS?

Can the Radio Shack scanners have the external volume modified?

I'm currently looking at the bearcat SC-150 or 220XLT handhelds
with 800MHz. What RS scanners do you recommend in the same price
range $160-$225?

Thanks!

Joby Sour

That's not the encryption scheme, rather the TDMA time frame sequncing. The
actual encryption key is around 40-bits. I don't thin anyone has a solid number
but 40 is the guess I've seen most often mentioned.

I don't think people really understand how frequency counters really work.
It's not like a scanner, where you tune to frequency several miles away
and receive. You can't just point the counter at a transmitter and get the
reading you want. The signal has to be stronger than the thousands of
other signals reaching your counter.

Yes. The AOR AR-8000.

AM FM NFM WFM, Plus: CW, USB, LSB.

100kHz to 1.95GHz (not quite 10kHz - 3GHz, but close enough).
So, can get shortwave (with a longwire antenna for best results)
All modes, all frequencies.

Wide variety of frequency steps, and custom definable to odd ones.
Gapless coverage if you know how to reprogram the EEPROM (or buy overseas)
RS232 computer control port
Backlit keypad and LCD panel
1000 channels in 20 banks of 50 channels each
Priority scan, forced scan, variable scan delay
Audio or Carrier scan detect
Squelch threshold
Alphanumeric ID tags for channels and search banks
20 search banks
Auto store
All sorts of handy scan/search modes
Dual VFO
Select Scan bank of your favorite stuff
Bank linking

...and more..

To me, the dream scanner, although it cannot decode digital information.

Mike

: JOHN OLIVER
: PCHH73B@prodigy.com

Wow. Bob. I can't believe I got to this one before you. :)

John,

I'm assuming you are using a handheld scanner. You need to be less
than one mile(sometimes closer) to pick up anything from a fast food repeater.
They are typically very low power.

No chains/locations necessarily share the same frequencies. I've found two McDonald's 5
mins away that are on completely different freq's. And I've
found a Taco Bell and a Wendy's three blocks away from each other using the
same freq's. Who knows.

Anyways, to save the newsgroup from the 800th post of the big list,
I'll mail you the recent updated list put together by a Bob Eisner with the
help of a few hobbyists.

Keith

>help that you can give me.

Many fast food restaurants are licensed in the name of
the franchise holder (e.g., Joe Smith Enterprises), not the more
familiar name like McDonalds, so they won't be found by a
simple database search. You need to find them by their location
in town.

If you know the approximate locations of the business of interest,
a map of transmitter site locations is very useful for unveiling
radio systems "hidden" behind unfamiliar names.

From the rec.radio.scanner FAQ article:

As I have already done for hundreds of radio enthusiasts,
companies, government agencies, and organizations across
the country, I will locate FCC licensed and selected FAA
transmitter sites in an area of your choice, in any state,
and produce a custom RadioMap(TM) report, including an 8-
1/2" by 11" scaled color map, protected by plastic. The
map is marked with transmitter sites, cities, highways,
airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize
the transmitter locations in your neighborhood, near your
office, and other places of interest -- from VLF through
microwave. The report lists frequencies, callsigns, and
licensee names. RadioMap covers police, fire, local
government, TV, business, industry, common carrier,
railroad, trucking, and many more types of transmitter
sites, excluding ham radio stations. Wireline and
nonwireline cellular phone and AM/FM broadcast transmitter
sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the
"radio environment" prior to installation of radios and
wireless microphones at customer sites. RadioMap is used
by the maritime and broadcast industries, as well as ham
radio operators to solve intermod interference problems,

and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

RadioMap has been favorably reviewed:

"... one of the most interesting reference products I've seen... ... an excellent reference tool." - RCMA Scanner Journal

"... truly an innovative product." - USSN

"...a Must Have!" - American Scannergram

Notes:

1) RadioMap is a trademark of Robert Parnass.

2) I cannot respond to electronic mail inquiries about RadioMap, so please call me some evening at the telephone number above if you have questions.

:I bought it was because I needed receive capabilities in the VHF-LOW range
:which my Alinco doesn't have. Anyone have one of these, or are familiar with
:the unit? Is it any good?

My Pro-50 works great in the low range. Be sure to re-fit the unit with
one of Rat Snack's inexpensive telescopic antennas - that's pretty much a
necessity.

Cheers, Dave

An educated guess: You might try holding down [MANUAL], [2], and [9] simultaneously while turning
the scanner on. If that doesn't work, try the same procedure with [SCAN] instead of [MANUAL].
This procedure performs a reset and clears all freqs in memory. Good luck!

> Jeff
>

Mine works just fine. Of course you have to take into account that there are thousands of frequencies out there reaching the counter's antenna if you live in the city. That nearby frequency you want to pick up has lots of competition from Radio and TV stations, cellular towers etc; it's got to be the strongest signal reaching the counter. For low power transmitters you have to be EXTREMELY close to pick them up, unlike your scanner which can be quite a bit further. If you are using the counter for scanning purposes, you would be better off with the scout and all it's added features. The RS counter on the other hand is good for checking transmitters and such.

3440. SCANNER ENTHUSIASTS!! READ THIS!!!

Newsgroup: rec.radio.scanner
Date: 1996-05-14 00:00:00 UTC
From: Andrew <jwz@kuentos.guam.net>
Message-ID: <319931D4.20F4@kuentos.guam.net>
Source record: 233993

****
Hello. My name is Andrew. I am a beginner with a couple
BEARCAT scanners. I have a pretty neat program which I
got from one of teh local bulliten boards. It is called:

The Scanman's Handbook...version 12.00

It is a DOS program which has (in menu form) lots
of frequencies, including the frequencies for:

*Police and fire nationwide
*security
*amusement parks (yes, incl. Disneyland)
*shopping malls
*television/radio
*cordless phones
*railroad
*drive-thru restaurants
*universities/colleges
*taxis companies
*the GoodYear blimp
*yes, and of course "lots, lots more!"

It also has some of the state-by-state scanner laws
as well as some basic equipment info. It ALSO has the CHP
frequencies as well as the LAPD map of jurisdictions.

So, how much will this program cost you? $49.95? No
WAY! $26.50? I THINK NOT! $9.99? Nope! It's free!

This is a zip file. It is not pirated software (hey,
I'm an honest guy :-) and is free to distribute. I can't send
part of it. I can only send the whole ZIP file (or if you want
i can make it into a compressed .EXE file) which is about 420000
bytes. It can take you 4-8 minutes to download (average about 6 1/2
minutes). If you would like it, please e-mail me. If you don't
want it, please don't e-mail me. It might take me a day or so to
respond. If you have any other questions, please e-mail me.

Andrew
jwz@kuentos.guam.net

PS-- I have NetScape 3.0 Beta. Is there a way to post the
attchment to this group? If somebody would like to give me
some pointers on doing that, I'd be more than happy to do so, too! :-)

I believe that these do NOT transmit the audio, they are merely electromagnets placed so close to the play head of your stereo that it picks it up.

3442. Trade R7000 for Scout/AR8000

Newsgroup: rec.radio.scanner
Date: 1996-05-15 00:00:00 UTC

Message-ID: <n9jig-1505961030320001@mu-ip-5.theramp.net>
Source record: 233795

If anyone is interested, I may be willing to trade an ICOM R7000 with complete covereage (25 to 1000, 1025 to 2000 MHZ) for a AR8000/Opto Scout combo.

My R7000 has the Remote control and 12 volt kits, original box as well as a Grove SDU100 Spectrum Display.

Your AR8000/Scout has the Reaction Tune option and cable.

All above is in excellent/mint condition.

E-Mail at below:

3443. AR8000 Package FOR SALE

Newsgroup: rec.radio.scanner
Date: 1996-05-15 00:00:00 UTC
From: flaxman@ktv.net
Message-ID: <3199f761.4949058@news>
Source record: 233796

I'm considering selling or trading my AR8000 for
"something better" if there is such a thing.
I will only sell as a package, and will not
split up the items. If you need more info,
feel free to email me.

AR8000 Package FOR SALE

1) AOR AR8000 Complete with cellular mod and US bandplan already done.
Opto
Scout interface mod also already performed. All set up for reaction
tuning!
Includes box, manual, wall plug, etc.
1) Optoelectronics Scout (latest firmware) w/charger, manual, etc.
2) Opto "stubby" antennas, one for the Scout, and one for the AR8000.
1) Opto CF802 Cellular bandpass filter. Works *great* on the Scout
when
reaction tuning.
1) In ear speaker for AR8000 for discrete listening.

Will sell for best *REASONABLE* offer over $900, or
trade for other high end scanner equipment. I will not even
reply to ridiculous offers.

> HD> of your own that you'd like to share with us ?
BB > I already sent you a list of things I have wrote for LMR trade
BB > publications.

No you didn't. You only made the statement that you had written some
articles for a mobile radio magazine. No details whatsoever. I gave you
magazine names and dates of publication.

> HD> I also hear that there is still great controversy over the
> HD> commercialism and his bending the rules to suit. He is such a

BB> Nah, not any "Great" controversy. As FIDO moderator, per FIDO, that
BB> echo is his. Simple. However he wants to run it is up to him.

Yes, I suppose you're right...it IS and always was HIS support area
for his books and business. Only thing is he's changed the rules to
make it easier for himself. I personally liked things better when
the fellow up in N.Y. was moderator.

BB> That is what FIDO Echomail is all about. Those that don't like it have
BB> the right to vote with their feet. Or be kicked out. How many echos
BB> have you been kicked out of?

The FIDO Scanradio is the only BBS area that I've been 'kicked out of'.
Probably because the moderators of all other echos have no personal
interest beyond moderating, unlike our friend Bill who tends to take
some not-unusual bickering to heart since it affects his wallet.
Thats where conflict of interest plays into things.

> HD> it to be to flog his wares. ie... his new brainstorm...a compilataion
> HD> book with regurgitated mods from the previous 3. Nothing new to
> HD> print...I know...we'll repackage the goods and market it for the

> HD> technically challenged. Fido Scanradio was and always will be the "Bill

BB> What is your problem with that? Jealous? Sounds like marketing to me.

My problem is with the major conflict of interest. FIDO echos WERE NOT created for advertising and personal gain. They are supposed to be public areas where people can discuss the subject matter, sometimes debates and flames arise but its all part of the picture. Bullying the users and booting them off without warning is not too fair nor is it democratic. And moderating such an echo by someone who makes money from that line of business seems a little too comfortable.

Am I jealous, uh...no ! If I had the time I could compile books out of publicly available information (with a little bit of my own stuff added in) but I have a real job and family that keeps me pretty occupied.

Getting back on track here Blake...YOU are just another Billy Bum Boy who runs to his aid whenever someone has a beef with him.
(You and about 4 or 5 others...you are all widely known. I've had many a reply from others via e-mail who 'know the crowd').

YOU challenged my technical abilities and I responded. You never replied back with your technical accomplishments. You were simply pitting me against Bill. You should never have brought yourself into the picture. I suggest you keep your comments to yourself unless you have a personal beef with me or anyone else. I wouldn't have had reason for any dialog with you had you not opened your mouth as a backbencher for Bill. Now I know enough to avoid you. Thanks for the forewarning.

>
> HD> You just have to keep an eye on the "busy" or "frequency in use"
> HD> light on the radio so that you do not interfere with other users.
BB> Huh? Nah. Actually, in a properly installed system, you will hear
BB> ALL traffic within range when you take the microphone off hook. Automaticall
BB>
BB> No need to watch the busy light.
BB>
BB> Now, we are installing systems with "Busy channel lockout, no monitor"
BB> that disables the transmitter if there is a signal on the channel
BB> without the same PL as you have. Then it will beep at you if you try
BB> to transmit while the channel is in use. Again, no need to look for the
BB> light.

To take it a step further,
aren't most or all of the later radios using DPL (Digital Private Line)
encrypt such data in the packet ? (Motorola anyway.)

> HD> POSAG: (I think it's actually "Pocsag" or something like that.)
> HD> I don't recall the what the acronym stands for off hand (Anyone ?)
BB> Chuckle. I am sure you wrote a technical article on this, but just
BB> can't seem to find it....

Haha... no, it sounds like you are the official whiz on this one.
You are starting to come off like a child now Blake. I don't claim to
be an expert on any one subject and I'm not afraid to admit it. Just
trying to help as much as I could and ask for further assistance where
required.

BB> If there is any more information I can share with you, please let
BB> me know. Of course, you probably invented it, so what could I
BB> possibly tell you?

Share with me your technical accomplishments with regards to scanners
as you challenged me in your original Cheek support post.
(Or anything technical for that matter.) Lets talk tech !

Unlike yourself, I'm not out to make an ass of you. YOU are the one
that came running to Bills aid with technical challenges on his behalf.
I responded to your challenges. I didn't hear back from you !
If you want to continue the "challenge" then lets stay on track rather
than getting silly and going off track because you can't support
yourself.

As the saying goes...put up or shut up !

Wrong..... I also have one of these. They DO transmit FM. They do
a pretty good job, also. The do have very minimal range, though.
That is to my outside fron antenna on my Ford van. I bought it
beause when I installed a CD player, I had no way to play back
micro-cassettes, etc. I USED to use one of the cassette-looking
attachments on my old AM/FM/Cassette in-dash to play
micro-cassettes and my scanner. Te FM transmitter works pretty
well, but it is very low-power.

Andrew,

Thank you for correcting my oversight. I have been following SCANMAN since about Version 8 and I didn't realize that Brian made Version 12 a freebe!

SCANMAN has two main bodies, US Government (25+ topics), and Non-Government (36+ topics). Scanman was created with the Southern California area in mind, however much of the information can be used throughout the US. Race Teams, Railroads and Airlines, Cell Phones and fast food are just a few of those defined in Version 12. In addition to the main topics, there are other outstanding text help, hints, rules and description files included, all related to scanning.

Brian has a real slick program format and search engine that make the package a real joy to use. In example, search for "FOYT" and in seconds, four channels are listed for A.J. Foyt race car(s) and other drivers and teams in the race car catagory are also shown on the display but A.J. "Foyt" is highlighted.

For serious and casual scanner enthusiast, this is a must have program! Perhaps with some encouragement, Brian will create a Version 13? SCANMAN is a program that deserves space on your hard drives.

Thanks again, Andrew.

I'm pretty sure the ECPA covers decoding *encrypted* transmissions, not
plain old data. If it was I think there would be quite a few people in
trouble who sell ACARS and Pager decoders.

3452. Canada~SCIS not CISO! INFO...

Newsgroup: rec.radio.scanner
Date: 1996-05-15 00:00:00 UTC
From: doc@dxnet.com
Message-ID: <319a192f.5658098@news.dxnet.com>
Source record: 233805

Canadian Scanner fans,

Thank you for your email replies! To help keep traffic on the NewsGroups to a reasonable roar, please email me DIRECT with any replies, your replies will remain confidential: doc@dxnet.com

Folks, I stand corrected, the agency name is SCIS and NOT CISO.

I am asking for as much information on SCIS as possible to pass along to all who contribute. SCIS is the CANADIAN equivalent of the US Central Intelligence Agency. I beleive the letters equate to: SECURITY CANADA INTELLIGENCE SERVICE.

*** I have two SCIS frequencies, but no channel designators.
*** I undestand SCSI share some RCMP channels. I now have over 160 RCMP active frequencies but no channel designators, any help here?

I hope to gather as many frequencies and as much information as possible. What do you know of them? Does SCIS encrypt voice traffic? Who makes the radios? Is SCSI listed in your local phone book and if so, what city you you live in? Have you seen any of the cars, vans or jeeps the SCIS use and any descriptions of antennas on them? Have you seen any HQ's and can you describe any antennas seen there?

Again, I will forward information I amass to those that help with known good data. No moochers, please.

Thanks, all!

Wow! When most people want a Big Mac and fries they usually just drive up and order. No need to make it more complicated than that.

Well one of those did clear the freqs but it did not let me enter new ones so
something is still locked. I tried a few more times and now it looks like it
is scanning 25 weather freqs since that is what it stops on. Do I really need
to take it apart and clean the keyboard or something like that? Any other
ideas?

Cross-posted to: rec.radio.scanner,alt.radio.scanner

The Blue Angel's are going to be at Andrews AFB here in DC on 5/18/96 and I am looking for any active freq's anyone may have come across during their previous shows this year. I only live about 1/4 mile from the base and will get to listen to all the activity during the show even if I don't get to head over to the base (but am planning on it).

I have seen the list at Monitoring Times, but even it says the freq's that are there are old and may not be in use.

Even suggestions on ranges to search would be greatly appreciated!!!

: How do you hook up the Ramsey SCA decoder to the GE Super radio III?

There's a guy that sells Superradios with SCA decoders built in to them,
their number is 800-944-0630. Other than that, you have to figure out
where the demodulated FM output is, then cut that trace on the circuit
board and install the SCA decoder there.

The scout is well worth the money. It has very nice features.
Try the CUB from Opto
Its only $150 or so and it works great.....Its basically the same as the Scout except without the reaction tuning, viberator, beep or memory storage. It does well on 800mhz!

> For that price, I'd expect it to be fairly sensitive. I need to pick up
> HT's transmitting at 1 or 2 watts from a distance of a couple hundred feet.

Yes it will do that.....with the right antena.

> I expect to pick up fast food freqs(on UHF) by driving through the drive-thru.

Again YES........using the right antena

> I expect to get hits from celluar phones in cars driving by.

I use a 800mhz antena (rubber duck) (1 inch long) and I pick up cars going the other way on a 4 lane hwy!!! I'm NOT joking.

> Are my expectations too high? Or is there another more affordable freq.
> counter? I paid $79.00 for my RS freq counter and am very disappointed.

I know I will get flamed but.....RS freq. counters are a junk for what you are wanting. You need a freq counter that has a filter.....so you can knock out those random readings......with the right antena (you need about 4 different ones) for the right frequency you are after you can get a reading from a good distance.....some exceptions : cordless phones, baby monitors and a few others.

The CUB even reads higher freqs than the SCOUT.....But the SCOUT has more features.
I highly recomend buying the CUB first.....compare $150 to $400.

The Cub is even in the same case that the Scout is in. Its sort of like the Bearcat 100xlt and the 200xlt.....the 200xlt just has more channels and more coverage

Yes
Its a good low cost scanner. It works well. I bought mine back about a year ago and its been going strong since. I use it in combination with my other scanners: AOR-2500, Pro-43, Pro-42 and a Pro-2024.

It does a great job on VHF and UHF. Low band is ok but I have seen better.

On a scale of one to ten it rates a strong seven.

Goran,

GSM without encryption is more complicated than you think:
Digital cellular systems use a complicated system of encoding and
modulating such that a normal FM scanner and other additional parts,
i.e. codec, will not decode anything.
GSM and the US TDMA are similar. CDMA adds the further complication
of spread spectrum. Highly sophisticated scanners would be needed to
monitor a digital system. A hacked digital phone may be the best
starting point.

First the modulation is not continuous, it is time sliced into 8 channel
slots, each channel gets 1/8 of the frame to transmit the digital bits,
and across 8 frames 40ms of coded speech is transmitted.

Second, the modulation is not FM, it is one of many variants of amplitude+phase shift keying - in GSM it is Gaussian minimum shift keying, the pattern of amplitude and phase is called a constellation.. Third, the digital information representing the codec speech is encoded with error correcting bits and broken up and recombined in a process called interleaving to minimize burst errors.

Given the above, the GSM scanner needs the abilities to monitor a time slot, demodulate the GSM constellation, de-interleave, apply error correction, and do the GSM vocoding for the conversion of speech.

I recently broke a clip on a hand held scanner. Does anyone have a scanner which is broke, burned up or busted that they will part with the belt clip? I know I can order one from RS but I hate fooling with those folks!

Its off of a Pro-50 but 99% of the PRO series have the same beltclip.
Thanks

Hi Jude,
I have a PRO-39 for sale, it's like the 34 except is smaller/newer.
It will do Cell-Phone, has 200 channel. Comes with Power/Supply
and Battery charger, and rechargeable AA Batterys (6 of them)& Book.
I am asking $180.00 for the scanner. O, it is as new cond.
Thanks,
Boyd

Danny,

The belt clip for the AOR AR-1000 is a perfect fit replacement for the RS belt clip on the Pro-43l, 39, 50, etc.

The AR-1000 belt clip is made of chromed steel, so it won't break. You can get one for about $3.00 from EDCO. Give 'em a call. I've bought several, and they work great!

>
> MJ

A few problems:
1)What you propose is a Federal Offense
2)The frequencies are not in the ham bands. You would have to modify a
ham tranceiver for full coverage transmit. If this was done, it would
not be FCC type accepted for commercial use, and this is another Federal
Offense.
3)even if you were able to transmit on the frequencies, I understand
that the transceivers have CTCSS (PL) subaudible tone squelch. Without
the tone, your signal would not break the squelch on the commercial
McDonalds transceivers.

In short, this is not a good idea. Keep on scanning, and keep legal!

Why should I buy Police Call when I already have the information?
The website listed above - with frequencies online - is mine. Besides, I WROTE
the "Scanner Master Upstate New York Guide" and am the Upstate NY co-Editor for
"Monitor America".

> it supposedly does work if your unit does SSB.

Sounds like he made a "Slope Detector". What happens is you tune your AM/SSB receiver to a frequency where your IF filters are rolling off in the FM signal's bandwidth. As the FM signal changes frequency, it "crawls" up and down the transition band of the filter, effectively amplitude modulating itself. Then you can detect the IF just as if it were actually AM/SSB.

It sure would be nice to have some competition to force Opto to improve
their products faster and force them to bring their prices down.

Could anyone tell me if the RS frequency counter is any good. I went into a local store and the salesman demonstrated it for me but he had to pu it right next to the transmission source to even make it work. I know that Optronics makes one. What are the differences between the two. Thanks, Monty

PKHARTLEY (pkhartley@aol.com) wrote:

: Thanks for correcting me! I was assuming that most SS phones used CDMA!

Can someone explain what the difference is between spread spectrum and CDMA? Isn't spread-spectrum the base technology and CDMA a particular implementation of it for use in cellular phones? Also, is CDMA getting used much anywhere in the US, and does it have any future. Or are there too many problems with it?

For Sale: (one each)

AOR AR-1000XLT Handheld Wideband Scanning Monitor.

Frequency Coverage is 500kHz to 1300Mhz with NO GAPS in coverage (This
is from the factory, not modified).

AM/FM/Wideband FM modes
Programmable Steps from 5 to 99Khz
1000 Memory channels
Keypad entry and rotary tuning knob
LCD Display

Comes with Case, Nicad batteries w/charger, Rubber Antenna, Owner's
Manuals, and a copy of Howard Borenstein's "Guide to the AR-1000"
book.

All in original packaging

$325

Radio Shack Pro-2025 Mobile 12Vdc Scanner

Frequency Coverage 144-174 Mhz and 420-512 Mhz
16 memory Channels

Includes AC power supply and original packaging. No Owner's Manual,
but this is an easy scanner to operate. Brand New condition
otherwise!

$50

>
>http://amsat.org/amsat/sats/n7hpr/rs.html

Dennis,

The AMSAT site won't answer Jeff's question. It lists the frequencies
for the Radio Sputniks. This is a series of Russian amateur satellites
similar to the American OSCAR series. The Radio Sputniks (RS) are not
the same as the original Sputniks (a scientific series) Jeff was
asking about.

The original Sputnik (Sputnik 1 - there were ten in the series
launched over a period of 3.5 years) was launched by the Russians on
Oct. 4, 1957. The Radio Sputnik series was named for that satellite.
The first Radio Sputnik was launched on Oct. 26, 1978, 21 years after
the original Sputnik.

I am one of the 'older' scanner people Jeff referred to in his
original post. I was 15 when Sputnik 1 was launched and while I don't
remember the exact freq it used, I'm positive it was not MW as Tim
Tyler suggested. I recall it as being in the upper portion of HF -
around 19-20 mHz.

: MJ

MJ -

Whether you want to talk to the worker or the customer, you should be broadcasting on 154.5400. This is the freq. that the worker transmits on and is repeated by the repeater on 33.4000. Now, whether your voice gets retransmitted to the customer or not is accomplished by using separate PL's. ie 100.0 might be used to retransmit and 131.8 might simply be ignored by the repeater and picked up by the other workers headsets. There was a message posted a few days ago with the correct PL's. Best idea, monitor both freq's to determine PL's.

Let me warn you that broadcasting on these freq's is against FCC regulations and is quite illegal. Be prepared to pay fines up to $10,000 for transmitting out of band (or in the amateur band w/o a licence)

Yes, law enforcement agencies can use inter-agency frequencies
for special operations, but another option is to use the locality's
other radio bands not normally used by police. For example, if a
police department wants to keep a sensitive surveillance off their
normal radio channels, they can use their city's service depart-
ment's frequencies on occasion. How many scanner enthusiasts who
monitor police frequencies also monitor garbage trucks?

On a recent stakeout, my partners and I used cellular phones to
communicate when we weren't in the same place.

Since I sometimes have to park my car in a garage that has only six feet of clearance, I wonder if anyone knows of an available folding antenna for all band scanning. My ham antenna (Comet) is of this type and works quite well. It is just too much of a pain to remove a mag mount and place the thing in the trunk every time I go into this garage, and to reverse this when I leave.

Please reply by E-mail since my ISP's news server is being replaced and some messages may be lost. Thanks in advance.

If you were a licensed amatuer radio operator (Ham) I doubt you would
be asking that question. If you are not, you don't need to be
transmitting on ham frequencies anyway. Regardless, the freqs. you
cited are out of the ham bands. Although some ham tranceivers can be
modified for out of band use, they would not be type accepted for
either of these freqs.

Source record: 233879

>Which Volume has the mods for the 2006? I want to do the 5200 channel
>mod.

>Thanks

I think the answer is a little more involved than you might expect. The original mod was described in book 1 (and it is 6400 channel mod). But that mod uses a row of mini-dip switches to control which bank of memories you want selected. In book two he describes much of the original mod, but not completely because the text in book two is meant to update the text in book 1. The main focus of book 2 is to describe how to build a keyboard controller for switching between banks (I bought both books and built the keyboard controlled 6400 channel mod). Now to further muddy the waters, it appears that Mr. Cheek has come up with a whole new method of expanding the internal memory of the Pro 2006 which he says is much easier to do (the old way requires removing a surface mounted memory chip and building a board with the new memory chip and keyboard control chips on it), and it adds a lot more channels to boot! I'm given to understand that he has detailed this new method in his own magazine, which, I hear, is available in back issues. As someone who has done the mod I will tell you that I am very happy with it. The extra channels are cool but all those custom memory banks (16 banks with 400 channels each, each bank the equivalent of an entire Pro 2600), each fully customizable, is what is really neat. Good luck with it!

Ken

I`m working for a local tv station`s news division,I need to listen to
Police and fire brigade in the area.
To get better reception I need a 3-band scanner antenna,
does anybody have any measurement`s for me ?
Please don`t tell me to go to a library,they don`t have the arrl
or any other relevant books.

Thank you for helping,
Jim Wilson

For any of you looking for a mobile scanner antenna, use a CB antenna.
They work GREAT!

Yes, included in a text file with the entire package was a text
file which said that version 12 would be the last one. However it also stated:

"But because of the fact that v12.00 will be my last version,
I have decided to distribute it for free."

I therefore assumed that it was free (a perfectly logical assumption),
however I don't doubt that Brian would appreciate a donation of any sort,
which of course would be up to the people I have sent it to.

> I posted Version 12 here, but the NetGods killed it and deemed it

I won't post it here, even though I don't see anything wrong with
it. I will, hoever, send it to anybody who requests it BEFORE May 25.

> This is the second important part! Contact: jwz@kuentos.guam.net

I recommend it also! It's a great program, with obviously lots of
research put into it. Hats off to Brian.

I currently use Scan*Star Plus v5.81 for MS Windows to control a PRO-2035/OS535 and I've been happy with Scan*Star. There may be better software available for your AOR radios, but for the OS535 and running under MS Windows it's probably the best software available.

It's not without a few technical anomalies -- that's a tech-support term for bugs -- but the tech support (via phone, fax, BBS or email) is responsive and updates are available via the internet at their ftp address.

It's frequency/data logging capabilities have increased my frequency lists for previously little known bands dramatically. Just set up a search range, open a data log file, open a frequency journal file and let it search and store for several hours or days. Come back later and analyze the log file for things such as signal strength, PL/DPL tones, air time and hit counts. A tip to determine which frequencies are good and which are simply spurious signals is to compare the total air time to the number of hits. If the air time is low and the hit count is real high, it can be assumed that it is some sort of interference. Of course you can include the journal file in your "scan list" and listen to all the logged frequencies.

What l like most about Scan*Star is that is runs under Windows (there is a DOS version) and it runs well. It does not interfere with other applications running on the desktop and I can switch between applications without missing any signals or watching some annoying hour glass icon. In fact I have it running right now as I type this usenet reply. There is a floating mini-status window that is always on top that shows the active frequency, any PL/DPL tones, and it has the basic PAUSE, SCAN and LOCK push button controls. I can also switch to the full screen tactical display to quickly re-configure my scan list with a few mouse clicks, then switch back to what I was doing. This was very important in my decision to choose MS Windows compatible software to control my radio. I did not want the radio control software to completely take over my computer.

After getting a BC9000 for it's triple conversion and extra features over my 890xlt, I decided not to sell the 890. Although it has dual conversion performance, it has excellent sensitivity and the AUTO SEARCH/STORE feature outweighs the intermod problems. I use both as search engines for new frequencies, especially in the military freq ranges. I just lockout/delete the freqs that have images/intermod and the rest are saved.

An attenuator on the 890 would have helped, but I've found using a short handheld scanner flexible antenna and right angle BNC adapter resolved most of the image problems.

If you can manage the price of the 9000xlt, it's performance is much better, if not the 890 is a good value if you want to monitor military action.

Try putting a scanner preamp on the input, that will boost the counter sensitivity. I'm not familiar with this counter, if it has a sample/hold or capture feature then it may help find nearby freqs with the amplifier, otherwise it won't help you much except for transmitter alignment/testing.

Thanks to the
ECPA, decoding and monitoring these data transmissions would be a federal offense, so I
really doubt that you
will see any company coming out with any kind of a device to do this anytime soon.

How much is a standard scanner preamp? And how effective would it be? Are
they available in a portable size? No, the RS counter doesnt have any
hold/capture features. Anyone suggest another freq. counter? What about th
cub?

I have a BC220XLT and alls I can say is the Twin Turbo is friggin fast man. It goes through 200 channels about 6 or 7 times in the same time it takes my pro2005 to do the same. Searching is fast too. Even though the "turbo" doesn't work in that band, it is still FAST.

:>Lately, I've been considering buying a scout. I just called Amateur Electronic
:>Supply to find out the price. $449.00. I'd say thats kind of steep. Is the
:>scout worth 449?

It is about what a good frequency counter costs, but I say it is a bit steep if you think of it as just a frequency counter.

:>For that price, I'd expect it to be fairly sensitive. I need to pick up
:>HT's transmitting at 1 or 2 watts from a distance of a couple hundred feet.
:>I expect to pick up fast food freqs(on UHF) by driving through the drive-thru.
:>I expect to get hits from celluar phones in cars driving by.

I've done all this except the drive thrus. You'll need to use a different antenna if they're in the area of 30mhz, also a lot are wired.

One thing to note, it does depend on the RF in the area you are at. If you're next to an antenna farm you will need to be closer to the HT's for a hit. IE you're at a parck where there's 4 towers putting out 150 watts each. Those towers will help keep the ht from getting to the scout. The scout is doing what all frequency counters do, count the strongest signal.

:>Are my expectations too high? Or is there another more affordable freq.
:>counter? I paid $79.00 for my RS freq counter and am very disappointed.

The scout does much, much, much, better than the RS counter. The RS counter is junk in comparrision.

3523. Cordless phone DTMF security.

I try to be security-wise about using my cordless phone. If I want to talk
about something private, or about to give me credit card number over phone,
I usually switch to a cordfull. This also includes using certain the tones
to use tone-operated services. For instance, if I am going to give my credit
card number using DTMF I'll switch to a cordfull.
Is my fear justified? Are there many DTMF decoders out there?
Obiviously, anyone with a >=16-bit sound card can capture DTMFs and then use
specially designed software to decode them. Does this software exist?
Pretty soon I'm going to be moving into an apartment, where my
concern will be multiplied by about 5 or 10. Is 5 or 10 times the
probability that personal information will be stolen enough to worry about?

I'll be buying a cordless phone in the near future: was wondering what's good these days. I know Uniden had a good one a few years back, but that's probably outdated by now. Prime concerns are range (shouldn't conk out going through more than 2 walls or beyond 25 feet) and snoop-ability. (Spreadspectrum or digital, I guess.) Cost should be under $225 or so, I guess.

On my 890, I must hit the AUX button (located on the top left) for each
channel I wish to record. The word LINE appears in the display.

The group is actually CSIS (Canadian Security Intelligence Service). They are the equivalent of the US CIA...Canada's FBI would 'sort of' be the RCMP.

>I would like to start a data base of everything I can find.
>Frequencies, offices, antennas, code list(s), anything directly

>North.

I am unsure of their radio frequencies, but from what I believe they are *all* scrambled. Their head office is located in Gloucester, Ontario on the corner of Ogilvie Road and Blair Road. It took them several years to build this brand new complex, and from what I saw firsthand...I'd say that over half of the building is underground! It's also kind of interesting to note that the CSIS headquarters are directly adjacent to the NRC (National Research Council) central complex.

> Can someone explain what the difference is between spread spectrum and
> CDMA? Isn't spread-spectrum the base technology and CDMA a particular
> implementation of it for use in cellular phones? Also, is CDMA getting
> used much anywhere in the US, and does it have any future. Or are there
> too many problems with it?

You are essentially correct. There are two primary kinds of Spread Spectrum communications (SS). Frequency Hopping (FH) where the carrier moves in discrete jumps among an number of pre-assigned frequencies, and Direct Sequence (DS) where the carrier is modulated with a pseudorandom spreading code. There are also hybrids of these which use both at the same time.

CDMA is a form of DS Spread Spectrum. In CDMA, the spreading code which is chosen for a particular user is unique and hopefully orthogonal to the spreading codes which are used by other users. This allows all the users to simultaneously occupy the same bandwidth without interfering with each other.

CDMA is being used in some newer PCS systems, and in some wireless LAN applications. However, the primary cellular systems based on CDMA are currently outside the US.

Your fears could be justified, depending on your neighbors. I have a DTMF decoder for my computer, and I can decode numbers like that. The thing is though, some people are dumb enough to give credit card info, address, phone, and more, all on the same call, all on cellular. Oh Well.

FP> I HAVE A 2006 AND WOULD LIKE TO DO THE CELLULAR MOD TO IT BUT
FP> LOST THE HOW TO BOOK.

Take off the top cover (2 screws on the back), look _behind_ the number 3 key on the fronnt panel (look INSIDE the scanner), and cut both the diodes you'll find sticking out there. Put the cover back on.

One diode, when cut, enables the cell band, the other speeds scanning up about 15-20%.

... Thhis takline iz slitely out of cofus.

I would like to buy a good general use scanner but know almost nothing about them. For instance, I would like the kind of scanner that will pick up emergency service broadcasts such as Police transmissions, but I have been told that many of these are not legal and therefore not available. Is this true?. If not, what should I be looking for.? Some advice would sure be appreciated. I have an RV and would like to install one.
Thanks Norm.

If you set the search step to 5 KHz it will do 300 steps per second on
all bands (this is for the 3000 and 9000, since the 220/230 does not have
step select)

Vol.1 has the original mod for 6400 channels using dip switches to select the 64 banks. Vol.2 has an evolution of the mod to make soldering easier and a method to switch banks via the keypad rather than dip switches. I can not verify if the entire mod is contained in vol.2 by itself since I did the mod for my scanner before vol.2 came out and never bought that one.

> Does anyone have experience with the rumored foreign CPU's available
> for the 2042? Do you LOSE any bands when you gain the complete 800 band?
> Does anyone know what one might cost or where to order it from?

The PRO-2042 is as yet not availeble in Europe (not 100% sure about Australia etc but I don't think so.) It is expected towards the end of the "summer". It will then be a short time (if things go as usuall) before the CPU and other spares become available as individual units.

The only difference between the two models will be the full 800MHz. All other features/coverage will be the same.

Assuming costs are the same as the PRO-2035, PRO-26 CPU's etc you will be looking at about $50/$60.

If anybody has the PRO-2042 service manual (again not yet available over here) could they confirm if it details two different main IC's (One for USA - one for Eleswehere ?)

Hope this helps.

In this case you should be able to talk to the McDonalds worker on
154.5400
provided you're using the right PL Tone (CTCSS). This McDonalds is most
likely using 88.5 Hz for Outside communications and 123.0 Hz for Internal
communications.

McDonalds also uses the following frequencies in the US & Canada:

McDonalds(Canada) 30.5800 154.4900
30.8400 151.6700
30.8400 154.1450

McDonalds 30.8400 154.5700
31.0000 170.3050
33.1400 151.8950
* 33.1400 170.3050
33.4000 154.5400

: In responding to my earlier posting which said my partners and I
: used cellular phones to communicate on a recent stakeout, Tim Tyler
: suggested our conversations would have been less than secret due
: to the number of people monitoring cellular frequencies.

Besides, cellphones are a lot more secure than using the commonly known police frequencies anwyay. Just the fact that there are 800+ channels to have to scan thru to find the one you want. And most of these will be active with other uninteresting conversations, by the time you eliminate all of these you will never find the one you want.

Javiation sells them, www.javiation.com.

Your money might be better spent on an Optoelectronics OS535, this
doesn't cost much more and it gives you computer control, too.

Okay, so with the OS535 board installed, and the proper password entered, Scan Star can access the "gaps" in the 800 band. Are the "gaps" only accessible when the scanner is under control of the OS535 AND the OS535 connected to a computer?

Is it possible to install the opto board, program a bank of channels or search range, disconnect
the computer and still access the gaps?

ATTENTION SCANNER ENTHUSIASTS!

Are you tired of fumbling through scraps of paper trying to
keep track of all your scanner frequencies?

Have you ever been faced with the inevitable lithium battery
failure in your 1000 channel scanner, only to not be able to
find all the frequencies you once had entered?

Are you saying to yourself "There's gotta be a better way!".

Well, there is! Announcing the release of DAYSCAN! A totally new
concept in frequency database managers! Some of the key features
of Dayscan include:

- Designed with the scanner USER and PROFESSIONAL in mind
- No limit database
- Identifiers for each entry for channel and bank numbers so
that you can keep track of exactly whats in YOUR scanner!
Also, entries include city, state, county, and service
indentifiers! There's even a notes field for each entry
for you to denote special information about a particular
frequency!
- Dynamic user definable search and printing features! Search
or print your database by user channel, bank, frequency, etc.

These are just a few of the key features of Dayscan! Every
scanner enthusiast will surely benefit from this freqeuncy
management system! If you would like to check out Dayscan, simply
call the Dayscan support BBS, at 513-259-6114. Log in as follows:

First Name: DAYSCAN
Last Name : USER
Password : DAYSCAN

395.500 Blue Angels - Air-to-Air
395.900 Blue Angels - Air-to-Air
395.900 AIR-AIR

* = Heard in San Diego at Blue Angel shows - Confirmed.

251.600 is Aircraft 5/6, the Soloists
263.350 is Flightline Maintenance - "My Plane's Broke, FIX it!"
275.350 is Aircraft 1-4, the Diamond Formation
302.150 is All Aircraft (Used at Friday Show)
307.700 is All Aircraft (alternate - used only in practice this
year)

Both 307.700 and 302.150 were used at different times during practice
this week - either might be used in the actual shows, or both might.

Note that not all frequencies are used at every airshow, there are a
lot of "alternate" channels, to avoid local users on a given channel.
Also, during practice, channel usage does NOT conform to actual airshow
usage - for instance, 263.350 may be used as air to air, instead of just
for calling the mechs on the ground to request repairs on landing.

Don't count on usage listings above - things change, or may have been
incorrectly reported.In article <4ne26l$cdu@dfw-ixnews10.ix.netcom.com>,

I believe this is incorrect. Our equivalent to the CIA is the Candian Security Inteligence Servise or CSIS (Prounounced C-SIS). There is a separate government agency similar to the NSA in the states that deals with monitoring radio/telco communcations and I'm not sure what that agency is called..maybe thats where the mixup is.

Monty-

I bought an RS freq. counter a couple months ago. I am very sorry that I did not return mine within the 30 days. I got it on sale but it's fairly insensitive. Most of your sources you have to be INCHES away from the transmitter. It might be useful if you were direct connecting your source, or if you have a project where you could use the counter nearby. But if you are trying to pick up signals a couple hundred feet away, or a low power transmitter, forget it.

I've been getting people's opinions over the last week about the optoelectronics Scout. Most everyone I talk with have had nothing but good comments about it. The Scout has 400 memories, a vibrate and beep mode, wider coverage (I think up to 2ghz, someone correct me if I'm wrong), amongst other features. What's nice, is you can leave your Scout sit someplace, come back, check the memory and find out how many hits PER frequency there was. Overall, from what I've seen, tis an impressive device. What really has prevented me from ordering one yet is the price. $449.00 new and I've seen them used for $350.00.

If that's way out of your budget, at least pick up the opto CUB, which is the Scout minus the memory, beep, vibrate mode. It sells around $139.00. If you're gonna spend $99.00 on a RS counter, spend the extra $40.00 and get a decent counter...

Keith

Notwithstanding that fact that this is illegal, the ones you want to
listen to are the base frequencies between 46 and 47. The higher
frequencies are for the handset and you only hear one side of the
conversation that way.

: Again YES........using the right antena

: > I expect to get hits from celluar phones in cars driving by.

: I use a 800mhz antena (rubber duck) (1 inch long) and I pick up cars going the other way
: on a 4 lane hwy!!! I'm NOT joking.

If you do get hits off a cellphone, you'll get hits at the mobile
frequency which only carries one side of the conversation. Even if your
scanner has reaction tune, you'll have to manually add 45Mhz to the
frequency to get the cell site which has both sides of the call. Seems
to me like this is something you wouldn't want to try while driving down
a freeway. Unless maybe someone else is driving. Plus, cellphones in
cars change frequencies and cells a whole lot because they are moving.
Another reason why you wouldn't want to try this in your car.

**In article , kamst39+@pitt.edu says...
**
**Lately, I've been considering buying a scout. I just called Amateur
Electronic
**Supply to find out the price. $449.00. I'd say thats kind of steep. Is the
**scout worth 449? I don't have an 8000 or anything so the reaction tuning does
**me no good(and honestly not interested in it anyways)
**For that price, I'd expect it to be fairly sensitive. I need to pick up
**HT's transmitting at 1 or 2 watts from a distance of a couple hundred feet.
**I expect to pick up fast food freqs(on UHF) by driving through the drive-thru.
**I expect to get hits from celluar phones in cars driving by.
**Are my expectations too high? Or is there another more affordable freq.
**counter? I paid $79.00 for my RS freq counter and am very disappointed.
**Keith

I have had several different freq counters, and currently use the RS
unit. The RS unit seems to have the greatest range, and best
sensitivity.

I routinely detect cell phones within cars travelling along the road. On
the higher power mobile units, I can get them as the drive past the
opposite direction, hand held phones need to be closer.

Drive thru windows are no problem.

The Scout, even without the Reaction Tune feature used is a marvelous
thing. Just stick it in your pocket and walk around the mall or
whereever. You will come out and view a list of bunches of freqs caught.
I have friends that have these and no one has been disapointed.

>Monty

If you by a freq counter, don't expect to use it like a Scout! Most freq
counters are made to be used with a probe to make measurements, or
possibly an antenna at VERY close range.

RS freq counters are not that sensitive, so a scanner preamp may help.
I've heard Opto's counters are more sensitive, but I think they sell a
preamp if you really want to use an antenna with it.

If you want to pick up something 25 - 50 ft away or more, I'd get the
preamp for the counter, or just bite the bullet and spend the $$ for a
Scout (used one's are a little cheaper).

Depends what you want to use it for. If you are going to be "finding"
frequencies to monitor on your scanner, you should go with the
Optoelectroincs scout. It's slightly more sensitive than the radio
shack counter. Also much more expensive, but you get many more features.
The RS counter, is very good for the price, but is more useful as test
equipment. It's hard to pick up low power units on any counter, as
stronger signals, and/or random noise may be stronger.

I have a Sportcat 150 that I bought from Racing Electronics. My
brother-in-law had a RS scanner comparable to the 150. Sold it and
bought the same as mine. Sportcat does what we want for our purposes.

>of both these handhelds....

I tested both the PRO-26 and BC3000XLT and published
a detailed comparison article in Monitoring Times. They are both
great scanners, but I prefer the BC3000XLT and bought one.

The BC3000XLT has better audio (larger speaker)
and better image rejection, especially on VHF-high band.
It has twice as many channels, boasts more features,
and I consider it to be a better value than the PRO-26.

From the FAQ:

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel
portable with 20 banks. Up conversion. Very fast scan,
search, and intelligent Auto Store. Mode, attenuator, and
delay settings programmable for each channel. 50
frequencies can be locked out during search. Larger speaker
than PRO-26 produces better, crisper audio. See "The Uniden
Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring
Times, April 1995 and "The Radio Shack PRO-26 vs.
Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in
Monitoring Times, August 1995.

PRO-26: 1985 vintage. Very good portable made by for Radio
Shack by Uniden. 200 channels, very fast scan/search. Good
display. Covers all TV channels, but spectrum adjacent to
cellular phone band is censored which prevents monitoring
parts of some trunked systems (e.g., IL State Police
district 4). Up to 50 frequencies can be skipped during
search. Limited image rejection causes 929 MHz paging
interference in 170 MHz range. IFs are 380.7/254.4, 58.075,
and 5.5/0.455 MHz. Audio suffers from small speaker. See
"The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by
Bob Parnass, AJ9S, in Monitoring Times, August 1995.

David, since you indicated your cellular traffic --at least pertaining
to the official mission-- was brief & vague, I wonder why it wasn't just
passed on a discrete but normal LE channel...

>Besides, cellphones are a lot more secure than using the commonly known
>police frequencies anwyay. Just the fact that there are 800+ channels to
>have to scan thru to find the one you want. And most of these will be
>active with other uninteresting conversations, by the time you eliminate
>all of these you will never find the one you want.

Kinda sorta yes, kinda sorta no, and hell, no! It all depends on what
the traffic is, & what the threat is. There are 832 channels, but they
can be searched. Saying there are 800+ channels paints a nice picture,
but the reality is that not all of those channels will be in use at any
one time.

Scanning thru the garbage to find the 'gem' is completely possible, and
even very probable if the targets are conversing long enough, and one
reason that the po-lice like cellular is that they can B.S. on it (use
some profanity, complain about some supervisors, etc.) & usually get away
with it, whereas that isn't often the case using law enforcement
channels. So it takes a lot of discipline to just call the other guy and
give a quick situation report & be off the phone in 30 seconds.

I've been on both sides of this type of thing, so I'm not just
speaking as a radio-geek here...

My Brother in Law is after a new PRO-43 but can't seem to find one locally or via RS (I told him he would be lucky).

I'm not sure if Durham Radio still have any but my past experiences with Javiation were excellent so I'm reccomeding he deals with them. They don't have the PRO-43 left anymore but do have the Commtel 204 which is just the same but finished in Black rather than RS Grey.

There price with full 800MHz & Air Mail is 195.00 English Pounds which works out around $300. I'm going to call them to see what they have left and my just get one for myself as a back up also.

Just wondered if anybody had one at all (Commtel that is) ??

Can anyone help me with why I can't get my 9000 Auto Record feature to work. I have a cable going from the line jack on the fron to the MIC input jack on my RS CTR-69 Tape Recorder and a Cable going from the 9000 AUX jack on the back into the REM jack on the tape recorder.

So far, nada...!

If anyone has gotten this to work, can you tell me what tape recorder you are using and the results with different cables, etc.

Your reply is much appreciated.

Yes, this is my first time in this newsgroup, so pardon my ignorance.
What exactly is the difference between a scanner and a shortwave
radio? Do the frequencies that each covers not overlap (why can't I just get
one radio to listen to both)? Also, is there a difference in the range that
each unit can pick up? Is a scanner meant more for local things, like
municipality-based listening, while shortwave is meant more for international
listening?
Thanks

John, the first thing I would check is the soldered connection at the
base of the antenna. You will have to open the case up to check it. This
has happened a couple of times to mine, when the nut that secures the
antenna gets loose. A drop of super glue cured the problem of the nut
backing off. Hope this helps.

** insensitive. Most of your sources you have to be INCHES away from the
** transmitter. It might be useful if you were direct connecting your source,
** or if you have a project where you could use the counter nearby. But if you
** are trying to pick up signals a couple hundred feet away, or a low power
** transmitter, forget it.

Maybe yours was bad, I have the RS unit, and it works great, I can get
cell phones hits on cars passing the house using my attic antenna, and
other friends that have the RS unit like it as well

I've been getting people's opinions over the last week about the
** optoelectronics Scout. Most everyone I talk with have had nothing but good
** comments about it. The Scout has 400 memories, a vibrate and beep
mode, wider
** coverage (I think up to 2ghz, someone correct me if I'm wrong), amongst
** other features. What's nice, is you can leave your Scout sit someplace,
** come back, check the memory and find out how many hits PER frequency there
** was. Overall, from what I've seen, tis an impressive device. What really
** has prevented me from ordering one yet is the price. $449.00 new and I've
** seen them used for $350.00.
**
** If that's way out of your budget, at least pick up the opto CUB,
** which is the Scout minus the memory, beep, vibrate mode. It sells around
** $139.00. If you're gonna spend $99.00 on a RS counter, spend the extra
** $40.00 and get a decent counter...
**
** Keith

I agree there. The Scout is a fantastic piece of work, and is on my wish
list...

D. Stark,

If you would make the purchase of the Police Call directory most all the frequencies you are looking for are listed. I believe the book sells for around 9.95. The book is available through several radio sales companies which are listed in Popular Communications magazine.

Unfortunately, yes.

There has been an addition to that act that makes it illegal to monitor cordless phone conversations.

>RCMP active frequencies but no channel designators, any help here?

The RCMP appear to have changed most of their channel designators recently. None of the old ones seem valid anymore.

In responding to my earlier posting which said my partners and I
used cellular phones to communicate on a recent stakeout, Tim Tyler
suggested our conversations would have been less than secret due
to the number of people monitoring cellular frequencies.

He's right. I neglected to mention in the first post that we
didn't discuss anything sensitive over the phones. Just things
like, "I'm about two minutes east of you," or, "Looks like they
have a visitor," are what we would say over the cell phones...
nothing that could compromise our assignments.

The comment about the cell phones was part of a response to someone's
earlier comments/questions about how police communicate in the field.

Sorry 'bout the confusion.

phreex (phreex@worldramp.net) wrote:
: I got kicked out of Universal Studios for scaning in on there freq's Can they
: do this??, what are your rights as a scanner??

Sure they *can*. It's private property... Many of the "theme parks" have rules regarding scanning that can easily be curcumvented by user descretion. When I've asked about the policy I've been told several "lines" that vary from concern for park security to fears that some of the parks "sensitive equipment" might be affected by spurious emissions from the local oscillators. Quite a stretch in either case...

I've been told that if I wanted to scan I should do it from outside the park and if that was the option that I chose the park would gladly refund my entrance fee. I've also been told just to put the scanner away and not be obvious about using it - like inside a camera case...

In short, if an airline can restrict scanner use onboard its "property" (ie the airplane) why is it hard to see why another business can restrict the use???? There's certainly no "constitutional right" to operate a scanner...

It's a stupid policy but there's plenty of those that we could talk about! Just use an earphone next time...

: card number using DTMF I'll switch to a cordfull.

I scanned my own Sony cordless phone, a 46/49 10-channel one several
years old, and found that it does not transmit DTMF tones over the air.
When I punch the keys, I hear "buzzsaws" going over the scanner, the base
is where the DTMF generator is. I think this a very good design
feature. While intercepting this would be possible, someone would have
to design and build a custom decoder box for this, and I doubt that
anyone would go to that much effort.

: CDMA is a form of DS Spread Spectrum. In CDMA, the spreading code which
: is chosen for a particular user is unique and hopefully orthogonal to the
: spreading codes which are used by other users. This allows all the users
: to simultaneously occupy the same bandwidth without interfering with
: each other.

Am I correct that one CDMA channel occupies 10 regular cellphone channels (i.e. 300Khz), and can carry up to 40 conversations at the same time? Also, what would happen if a 41'st conversation joined in on a channel which already was at its limit? I believe that all PN sequences are orthogonal to all others, so that the limit of 40 per channel is somewhat arbitrary. Each additional user will degrade the performance, but the degradation will be gradual, not like a regular cellphone system where there is a hard upper limit on the number of channels.

Is each PN sequence based on a unique N-bit (64 or 128??) code which is assigned to each phone, known to the phone company, but never broadcast over the air?

Also, why is CDMA being deployed in other countries but not the US?

>well, but it is very low-power.

So you are saying that the cassette inserts that have a cable to plug into
your audio on your CD player/scanner are transmitters? How come on my
stereo (and most I've seen) when you insert the tape, the tape player
starts playing and you get the sound from the CD player. Never had my
radio, or any I've seen with one of these been in fm-radio mode while
listening to these. Or are you talking about somthing diffrent, I have
also used trunk CD-changers that have a low power FM-transmitter to relay
the audio to your stereo.

I think that you just mis-understood what I meant ;)

Also, is there a difference in the range that >each unit can pick up? Is a scanner meant more for local things, like >municipality-based listening, while shortwave is meant more for international
>
>listening?
> Thanks

Scanners usually cover 30MHz and up and have FM & (sometimes AM) demod. Most have 50-200 channels that can be programmed and scanned. Scanning means the receiver tunes the channels sequentially and stops only when the squelch breaks. Scanners are, in general, meant to receive communication transmissions (police, fire, etc.) not broadcasts (news, music, etc.). The scanner lets you listen in on several channels (checking several each second), SW radios are meant to tune to a single channel and listen to a broadcast. Like I said, this is IN GENERAL. There are some high end ($$) scanners on the market that also cover .1-30MHz and have SSB and AM. These can also pick up shortwave freqs. Some of these SW/scanners are marketed as "communication receivers" (ICOMs, AOR5000). These tend to have features of of both.

In article <4nh8ii$k6h@dfw-ixnews3.ix.netcom.com>, jonma@ix.netcom.com says:
>
>What are the frequencies used to pull in the audio for UHF and VHF TV
>broadcasts?
>
While your question is quite vague, I think you want to know what
frequency to tune/program your scanner so that you can listen to
tv audio
CH# FREQ
2 59.75
3 65.75
4 71.75
notice the 10Mhz jump instead of the normal 6MHz.
72-76 is not allocated to tv, but instead to RC/pagers/fire box pull
stations/airport markers/etc
5 81.75
6 87.75
notice another "hole"
FM BCB/air coms/gov/ham/public service/fed gov/
7 179.75
8,9,10,11,12,13 ADD 6MHz FOR EACH

14 475.75
15 =CH14(475.75+6MHZ)
16 =CH15(481.75+6MHz)
I think that you get the idea. Every tv ch is +6MHZ from the one below
it. Cable is different and fills in the spaces between 6 and 7(most cable
systems feed FM BCB and use 108 thru 174 for "TV") and ch13 and ch14.
I am not willing to type this out all the way up to up to ch69 (ch 70
through 83 are now allocated to cell phones.
Good luck and I hope this at least get you pointed in the right direction.

No, the source code was released a few years ago and many people have
gone over it with no discovery of a "back door". PGP is hardly an
industry, it's a free program. ViaCrypt sells the commercial version for
around $400. The best way to decrypt PGP is brute force and that could
take a looooong time. That or you could try hacking (guessing) the passphrase.

3610. Ar8000 Commands??

Newsgroup: rec.radio.scanner
Date: 1996-05-17 00:00:00 UTC
From: neil@castel.demon.co.uk
Message-ID: <nCFCED9A2@castel.demon.co.uk>
Source record: 233652

Does anyone have a comprehensive list/manual of commands AND how to use them (i.e. basically the same as the interface manuals) for the AR8000 and CU-RS232 interface? I've already got a list of commands and what they do, so I'm not after that .. more how they're used.

Plus, how do you change the EEPROM info with the interface? I'll only be using basic terminal software, so would I be able to upload a file as ASCII to the interface and change the bandplan etc? I can't seem to find a command that details how to do this. Also, how do you get to see what's in the EEPROMS? I already know the EEPROM web pages, it's just I'd like to know how to do it myself.

Cheers.

I would think so, you were on their property, scanning on freq's that
they own. If you had been in your car off of their lot then that is
another story, or even in your home. But inside their studios would
not be a good place to be scanning for freq's that they use.

[Article crossposted from rec.aviation.misc]
[Author was John M. Vogel]
[Posted on 17 May 1996 13:35:27 -0700]

Today at Lambert-St. Louis International. I took my scanner along and sat in the viewing area just west of runways 12R&L. First hint was something like "TWA XXX, you won't be able to make it out in time; continue holding your position. You know what's coming. Expect a delay of 10 minutes". I counted six aircraft holding short of 12R. Pretty soon Air Force One was visible; quite pretty. Then "St. Louis Tower, Air Force One has visual", "Air Force One, winds 15 at 190, cleared to land 12 left". Nice touchdown. Then AF1 sat stopped on the runway for several minutes before it headed north toward the McDonnell-Douglas complex.

Someone by the callsign of North American 91 was kind of hot about the hold - they wanted servicing and catering or something.

Oh, one of the helicopters' callsigns is 'Nighthawk' - The President was flown to a local high school shortly after he landed.

Glad I was there :)

John

It seems that whenever I'm searching a frequency range for some new active freqs. this always happens... Let's say I'm searching 165-166 mhz for instance, I'm sitting by the scanner but get nothing. As soon as I walk away, I hear a contact, rush over to the radio, but it's over. I sit there and stare at it for ten min. but nothing, nothing, nothing. God forbid I should have to step down to the basement for a quick moment, I'll hear the thing squaking like crazy up above, but of course once I return it's silence again. I'm beginning to feel like there is some kind of conspiricy going on here! Is there any name for this phenomenon? Does it strike anyone else?
No, I'm not set up for a computer interface, so I can't solve my problem that way. Guess I'll just have to try to cope as best I can :)

Just got the message tracker software with the interface cable. (phone plug)

Unfortunatly can only decode digital pages on 1 of the 931 mhz. local paging freqs. None of the other seems to work. With alpha pages, nothing but gibberish.

I'm using a 2006 and have also tried a 760XL with the same results.
I have a good external antenna, and have followed all he recommendations in the manual without sunnerccess. I'm also running from a clean DOS boot & not shelling out of windows. Computer is a Canon Innova book 360CD.

Anybody have any ideas? I understand there may be a better way to interface with the radio with a direct connection?

Thanks!

Brian

What I was saying was that THERE ARE TWO TYPES, A CASSETTE AND A FM
TRANSMITTER. The other gentleman was correct when he stated that
his unit transmitted in FM.

David,
What you want is the Scanner Master NY/NJ guide book. This will have
almost everything you will most likely want to listen to. However. the
current (5th. ed.) book is already 3 yrs. old, but the 6th. ed. is supposed
to be ready in about 2 mos. Call 800-722-6701 to order.
You really need specific freqs. to get anything intelligent out of your
scanner. Simply using the service scan feature will mostly get you active
freqs. that
could be nowhere near *your* actual area, and may not even include the
ranges you require.
Good luck,
Phil

Yeah, and you misunderstood what I meant! Read the original post! I
recommended using a cassette adapter, and then asked the guy what the
range was on his FM "sound feeder"!

I NEVER said the cassette adapter was a transmitter!

I never wrote anything about background sounds. That quote should not be attributed to me.

Someone asked why my partners and I didn't use normal two-way radio communications, since what we said on the cellular phones wouldn't have compromised our assignment. The answer is simple... we weren't in our geographic jurisdiction and didn't want to interfere with communications that originated locally on what would be our frequencies back home.

There was nothing particularly sensitive about this particular stakeout. Most of you seem to be reading things into this that shouldn't be implied. It was just a simple stakout in another jurisdiction which required us to find a different way to communicate with each other than we would if we were in our home territory. Believe me, I don't get involved in super-secret operations.

Hi Jay,
The turkey gobble as a lot of officers call it is know as MODAT TONES. They are transmitted to identify
each radio that is logged into our system. When a patrol unit logs on with his Mobile Digital Terminal MDT,
he logs on with the 4 digit number that identifys which ROVER he is using. CAD (Computer Aided Dispatch)
interpets that code and displays a unit identifier for the PSR. Police Service Representative (dispatcher).
It saves time so that the unit does not have to identify itself every single time they transmit.
I work down on the dispatch floor for LAPD. I am one of the Maintence Techs for the system.
So I hope this helps. I will eventually get pictures on the web. I have pictures of the radio tower above
the hollywood sign. www.earthlink.com/~aa6rv

Take care,
Dave

>implementation of it for use in cellular phones? Also, is CDMA getting
>used much anywhere in the US, and does it have any future. Or are there
>too many problems with it?

Many people seem to get these things confused, so I think I'll clear some of this up.

The basics behind Spread Spectrum is the transmitter will transmit a short busrt of data or anolog voice, on one specific narrowband frequency, usually in an FM mode. The transmitter then selects a new frequency and transmits another burst. The receiver will of course have to change to the new channel in sync with the transmitter, or it will become lost. Some Spread Spectrum technologies use a psuedo random number generator in the transmitter and receiver, starting with the same seed number so the changes are known to both. There are other methods for determining the next frequency, but I'll leave it at that.
Spread Sprectrum is handy in a noisy (RF) environment, since the noise (or interference) will usually be on specific frequency. If there is any data loss, it will usually be limited to one burst, or a small amount which can be retransmitted.

CDMA on the other hand is actually very wideband FM (around 1.5MHz bandwidth). It is a complex transmision, so somebody must have started refering to it as Spread Spectrum for ease of explaination (or ignorance) and it stuck.
CDMA is based on mixing together all traffic to all phones, and transmitting it as one signal. On the reverse link (phone to base) the same mixing happens in the air, so the phones require power control so their signal level is recieved at the same level at the base. So if you are parked under the base antennas, you'll be using very little power, and if you're in the fringes of a cell, you'll be outputing more power.
If that sounds like interference, well you're right. To solve this, each phone charachterizes it's data with a certain bit pattern. The base equipment will be able to pick out each transmission as being unique, even though they are all on top of each other (this is the same method on the forward link [base to phone], though it is easier to control since all bit patterns will be heard at the same level). A good analogy is when there is a roomful of people talking at the same time, you can pick out one person's voice and understand what they are saying.

If someone is able to make a reciever that can decode CDMA into voice, I would be very impressed, especially if it could be done for a reasonable price. I can promise you that that decoder that this thread was started about won't decode CDMA.

As far as where is CDMA being used, I heard that Airtouch in Los Angeles has begun commercial deployment of CDMA.
CDMA does have a future, even though there are many doubters out there. It is a new technology, and some aren't giving it a chance to get on the market and prove itself before comdeming it.

I hope this answers your questions and disbans some misunderstandings by others.

Dan, as a ham you should know better than that. Yea I tear the tag from my
pillows, don't come to a full stop, drive 85 on the freeway (can't say I
pour oil down the drain), but these are not malicious offenses.
Interfereing with a business radio system is downright stupid and
immature. I consider this along the lines of running over rural mailboxes
or winding up you tires in the middle of the night.
If the original poster is serious about interfering with Macdonalds, then
he would be the same type to cause you and I greif by interfereing with
amatuer repeaters. This stuff should not be encouraged.

Will the AR 8000 be able to follow transmissions on the new system being put into place here in Seattle? I've heard that unless you have the proprietary Motorola chipset, you're out of luck... Unless you want to fork over about $2000. I also heard that they current system will continue as a "courtesy" until June 1.

I appreciate what the new technology will ultimately be able to do (voice and images), but don't we have a right to listen? Maybe they could just rebroadcast on some other freq as well as having all their new advances?

All help appreciated! I just might be selling an AR 8000 if I can't listen to the police any more ;(

No, the Scout is wide open. The Xplorer has the audio blocked in the cellular frequency ranges (per Optoelectronics support personnel). Plus the Xplorer will not accept audio from another radio for decoding purposes. :(Makes one seriously consider a Scout/ASP104/440 combination but the cost is a killer.

My only problem with the "dummy cassette " connector is that the cassette drive is constantly running. I ditched mine when I found a Philips wireless headphone set. Instead of tuning to the headphone radio I tuned to the car radio.
Recently I fitted a Patrolman to my car and find that it is far superior to compromise methods.
I would recommend the wireless systems for those who do not want a dedicated installation.

I would like to get the frequency for "Police Channel 5" in Howard County, MD. Please send email to me at csmith1@ccgate.hac.com.

Thanks!

In the United States, owning, installing, posessing, selling, or
obtaining, accepting, buying etc. a modified scanning receiver is
contrary to law.

In frosty Canada, here, anything goes.

Move north eh?

Yes the software is out there... It is only $20 to register via
shareware. I found it on the net by doing a search on DTMF. Or you
could buy a box that is designed to it full time for a little of $100.

3653. Repair Tips for Bearcat Scanner Radios

Newsgroup: rec.radio.scanner

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1996 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

Schematics and Parts Available

Some schematic diagrams may be obtained from
Uniden/Bearcat's parts department, (800)297-1023. Uniden |
currently charges a flat rate of $54 for scanner repairs.
They will repair and return "out of warranty" items without
an estimate unless the repair charges exceed the flat rate
charges. The phone number for repair is (800)297-1023.

If Uniden doesn't have a schematic, try obtaining a
Photophacts from Howard Sams Publishing division of
Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. *

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Athough there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner

owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S |

[NOTE: The first version of this article appeared in the |
RCMA Newsletter, December 1988. It may not be reproduced |
in whole or in part on CDROMS, in bulletin boards,
networks, or publications which charge for service without
permission of the author.]

The squelch control in some FM monitor receivers is
difficult to use because of too much hysteresis. The
American Heritage Dictionary of the English Language
defines hysteresis as the:

o "Failure of a property changed by an external agent
to return to its original value when the cause of the
change is removed."

It's like having play in a car's steering wheel, or
backlash in a gear set. Too much hysteresis in a squelch
circuit forces one to keep the squelch at a tighter
setting, missing weaker signals when scanning or searching.
The squelch hysteresis problem was first addressed in a
1984 article about the Radio Shack PRO-24 crystal
controlled scanner.

Why do engineers design these circuits with any hysteresis?
Basically, hysteresis prevents weak signals from "popping"
the squelch open and closed rapidly, which would be very
annoying to the listener. A squelch circuit with hysteresis
requires a stronger signal to open the squelch than it does
to keep it open.

Models cursed with too much hysteresis include the
Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003,
PRO-2004, and others. Don't despair, the fix is simple for
most radios. I've successfully reduced the squelch
hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback
from the squelch gate input to output, through a resistor.
The higher the resistor value, the less feedback there is,
and less hysteresis. My modification involves replacing the

"stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden | models, because the squelch hysteresis is partially | determined by firmware inside the processor IC. |

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers			
Receiver Model No.	Res-istor Value	Stock Comments	
Radio Shack PRO-24	R35	33K	replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197	47K	try 220K.
Radio Shack PRO-2004	R148	47K	remove R148 or replace with 220K. On linear board, between pins 12 & 14 of TK10420 (IC2)

Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
taxis, and buses are all equipped with radios and you can
listen to them. You can monitor the local sheriff and fire
departments to hear about events "as they happen," before
the news reporters hear about them. Hostage dramas, bank
robberies, car crashes, chemical spills, neighbor and
domestic disputes, tornado sightings are all fair game. In
a single afternoon, you can hear a high speed police chase,
Drug Enforcement agents on a sting operation, and
undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly

reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer to replace the stock antenna with an Icom FA-1433B dual band flex antenna which is thin and very flexible while providing better performance than a stock antenna.

Although it is small and somewhat tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Since 1988, I've used the "Thin-Stick" 18 inch telescoping antenna for extended range on my portable scanners and 2 meter walkie-talkies. The Thin-Stick, made in USA by Smiley Antenna Co., Inc., is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend

reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two

companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The 1996 editions contain selected business listings, too, although callsigns are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new, 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees,

listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about

$100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall

security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an

outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $27.00 per year, which includes the monthly Scanner Journal, approximately 50 pages in 8-1/2" x 11" format. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. The RCMA web page is at http://comp.uark.edu/~plaws/rcma/. The RCMA electronic mail address is RCMAHQ@GEnie.com.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at: |

- the Destiny Restaurant, on Rand Road, in Des Plaines, |

- Philly's in the shopping center at the corner Rt. 83 |
and 53rd St. in Willowbrook, |

- The Great Escape, on Irving Park Road, Schiller Park |

and at other restaurants.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call, published each year in 9 regional
volumes by Hollins Radio Data, and sold at Radio Shack and
larger book stores for under $13. Police Call is basically
a computer printout of FCC license information in the fire,
police, local government, and conservation services in two
lists: by licensee name within state, and by frequency.
Later editions have included a few pages of local airport
and nonsensitive federal government frequencies. The 1996
edition contains selected business frequencies, too, but
callsigns are listed only for local government and public
safety licensees.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local

agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information

fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs
